Ive seen references to something called a BGM partition, and was curious as to just what they are, and how they affect me. Why do I ask? Well, I received a second-hand TT that has a 250mb SCSI drive, and there was a BGM partition on it (it looks like it was partitioned with ICD utilities). But I wiped it out, and used HDX and AHDI to install a new single large partition. All looks well, and when I do a 'show info' on the drive I indeed see lots and lots of meggage, as I would expect

Glad to hear you agree =-) Now: who would be the great Wizard to make dreams come true ?

> Someone did do a patch to make Microprose Golf more compatible... I would have
> tried it, but I couldn't make a back up of the master disks to try it on :(

It's kinda crazy; people are almost forced to use cracked, illegal games on Falcon - and why..? Because the original ones (take e.g. F19 Stealth Fighter, that MicroProse Golf, ...) often don't often work on Falcon even with the aid of Backwards program. And often the reason lies in physical copy protection that Falcon can't handle... BUT then someone removes that protection - and miracle: F-19 (and some others) work again!

It really is a _SHAME_ that software houses don't bother to fix their ST games themselves to become Falcon-compatible..!!! Who can blame someone who has bought e.g. F 19 in full price, then discovers that his legal copy is useless in his new, great computer - and finally finds some cracked, maybe even HD-installable copy that works? I can't! We buy games to play them - not to fiddle with all kinds of tricks (caches on/off, exceptions table moved or not, etc..) - and finally find out that it won't work! Knowing that the maker of that game doesn't care a shit. Because he's "not supporting Atari anymore"..

Maybe those skillful crackers could do something more legal - and code some fix-programs to be used with legal copies of games. And that guy who wrote the Formula One GP editor (!) program for AMIGA (!!) - he (or is she "she"..;-) should be bribed to do one for Atari-version, too..!

What do you think?

Tommi & Falcon-030

1858. Falcon Games?

It was none other than Rod McCall that wrote on 24 Oct 94 that ,

RM> Exactly what is available for the F030 at present? Or what is in
RM> development?

Contact 16/32 systems they are about to release LLamazap ,Steel Talons
,Road Riot ,and Dino Dudes. Starting with L'Zap in the next couple of
weeks.Others to Follow by the end of the year (projected).

Robinsons Requiem will be Falconised I beleive and The ST version running on
the Falcon is very good ...the native version should be well worth having
.(Daze marketing)

All the Ishar Games have Falcon versions ,I3 I haven't seen so I don't know if
thats out yet however.(Daze marketing Again)

Most of My Fav ST games run on the Falcon many of them greatly
improved by the faster CPU...big exception Falcon itself :-(although the doc's
for Backwards v2.70 claim it should do from V2.64 onwards ...does anyone know
how ???

:
Craig,
I strongly disagree with you...
I run a stock 1040STe with both colour and mono screens. I don't have
any hight resolution vidio equipment..but I AM very interested in
the WEB. I don't do big graphics projects with my computer, hence it
is not worth it for me to dish out thousands of bucks to get high res
pictures with thousands of colors just for running mosaic. I use
my system for text processing and music applications, and the WEB can
be just as valuable a tool for me as it is for those dealing with
graphic intensive work daily. Just because I don't spend money for
a beefed up system I don't need...doesn't mean I don't care about the WEB.

There is no reason to have a minimum resolution...
There is no reason Atari ST Low Medium and High resolutions can't be
practical as a web browser. It won't be as colourful...and it may require
each picture to be in a gem type box for scrolling should it not fit entirely
on the screen..but the modes can still make quite useable WEB browsers.

I'd suggest that in writing Mosaic for the ST/STe/TT/Falcon line of
computers...all video modes be supported.

It seems the most practical way to do this is by making the entire program
window intensive so pictures can be scrolled, and tucked neatly out of the
way with a shrink icon when other desk top things need to be reached.
There can be optional modes should you decide to take advantage of the
ST 512 color modes, or STe hardware scrolling and blitter set up, that
would pop that picture into the full screen non GEM mode required.
For those lucky enough to have high res cards...a TT, or a Falcon...
if the program is properly written by the standard ST resolutions...

it should pose no problem at any resolution.
Actualy, it may serve the masses best if Mosaic for Atari shiped
with two different binarys on the disk.
One for us lowly M68000 based owners..and another for the 68030 and up...
this way space for the old ST users wouldn't be bogged down with unused
cashe routines and such.

I know little about programing...but it seems to me the biggest problem
faced is memory, and uncrunching the pictures at a reasonable speed.
Are web pictures sent to Mosaic in a compressed format? Or do they
just zip right in one pixle at a time? Is it vector graphics? How much
of the drawing is actualy up to the terminal running Mosaic, and how
much is already done on the other end?
These seem to be the key problems to me.
Is it possible to do all this in one to four meg of RAM?
Those are the only REAL problems I see...
You might have to require well more than one meg of RAM to make
this thing work. But there is no need to place a minimum graphics
capibility on the program. I wouldn't care if the pictures were in
Grey scale..or a bit blocky...so long as I could tell what they are,
and it doesn't take 45 minutes to draw them.

Also...all of the multi tasking platforms I've researched claim to work
with any program that doesn't break the TOS rules. Keep your code clean,
and stay in touch with the folx that write these alteranate OS add ons,
and all should be okay.

For those of us running 1 to 4 meg ST or STe systems...the multi-tasking
capibility seems rather trivial to me...as I'd think we'd need every
byte of RAM for holding all the graphics information. That's just a guess,
but I'm willing to make those kind of sacrafices so long as it works well,
and fairly fast.

If my machine will run it...
I'll buy it.

I am in to digital recording utilizing the FALCON. Needless to say I
have a few add-ons attached which make it impossible to move the
keyboard even slightly..... I assume there are STILL no economical
cases available in the U.S.A., so I was wondering if anyone has tried
the keyboard detachment kit sold in the US by ATY Computer, as
advertized in ST Informer ($85)??
Another dealer told me that it works but that it looks tacky. I know
there is another adapter which allowsattaching a Mega ST(e) keyboard
BUT this requires cutting a notch in the Falcon case (which I don't
want to do). Any comments appreciated.....

az>Is it possible to use GNU C to compile RSC files, and how to tell
az>GNU C to do such a thing?

Well, you can't do that at all! I don't know wether there is an
utility that converts C to RSC, but AFAIK there isn't any.
When you want to translate an RSC-file you can use a resource editor.
One of those is called ORCS. It's shareware and both German en English
resources are avaliable.
I don't know if there is a ftp you can get it, if you I could UUENCODE
it to you.
Don't know if there are other resource editors.

>of the drawing is actualy up to the terminal running Mosaic, and how
>much is already done on the other end?

Pictures, either in-line or on HTML links are nothing but standard GIFs/BMPS/JPEGS, etc. The same is true of sound - they're just sound files in some format (is it WAVs or that Macintosh one??) and, also, MPEG viewers and everything else.

The way Mosaic works is this: it knows how to display/play certain file types and will show these in the normal Mosaic window. However, if it comes across other file types, it searches a list, definable by the user to see if it can show/play it with any external program the user has. So, if Annius does the same, Falcon people can, for example, use one of the MPEG players to play back any downloaded MPEGS.

>Is it possible to do all this in one to four meg of RAM?

Depends entirely on the size of the file being downloaded.. generally, if PC users can (just about) get by on 4MBs than Atarists will be able to get by okay.

>You might have to require well more than one meg of RAM to make
>this thing work.

Definitely - but 99% of the people who have any interest in the web will have more than this.

>Again just make sure it runs well under magiC. I'll be one of your first
>customers.

Yeah, my point about the TCP/IP stack was that it would allow
third-parties to write any add-ons they wanted. They needn't even be
connected with Annius (although obviously Annius would be paid either
commercially or shareware for the users copy of 'TOSSock' [g]).

It would give us all the flexibility that the PC/Macs/Unix people have
right now - only on the platform we own and like. It would be very cool.

I did download ORCS, off an atari.archive mirror (specifically
from src.doc.ic.ac.uk). Quite a nice program to use, and rather
easy. Problem is that when I try to open some RSC files, ORCS
tells me the file is not a resource file, and aborts! :-(

Hi Ewout,

I think the problem lies within the handshaking, probably the RTS/CTS or
DTR line. Did you set your terminal program for RTS/CTS handshaking ?

Succes,
Gert

1886. Doorway for Atari ST? / Recap on W3 discussion

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 01:36:23 UTC
From: UPS500@ibm.rhrz.uni-bonn.de
Message-ID: <1706016A7S85.UPS500@ibm.rhrz.uni-bonn.de>
Source record: 178074

Hello everyone!

Is there a program that enables an ST to control programs
remotely (doorway / Carbon-Copy lookalike)?

Please e-mail me with any information availabnle. Thank you.

Also: I only got the last glimpse of a disussion about
W3 viewers for Atari-ST. Could someone who has followed this
discussion send me a recapitulation on this? Also, is it
possible to emulate graphics on monochrome-monitors with W3-
viewers? Which SLIP - kernel is needed?

Best thanks and wishes

Looking for anyone whos installed the CaTTamaran accelerator for the TT, and wanted to get some ideas.

For only $100, it seems like it cant be beat. Ive downloaded the demo software, and went thru the 'run me first' installation tutor, and it looks pretty simple. It states that installation in a Rev G system is easiest, but I dont have a Rev G. The demo didnt mention anything less than this, altho I would hope that the install instructions would cover such things (dunno what rev my system is) I am not afraid of a soldering iron, but am afraid of screwing things up.

Roger, we can't do anything unless Aaron tells us it's okay to do. It doesn't help how many people have said something, it's Aaron's word which is the law here. I sure wish i could help those guy's who havn't received their key and also the rest who want to use Freeze, but can't get hold of an key. But we have to push Aaron to release it as Pd before we can do anything.

I have Upoint running here, but i have no idea why this is happening to you.
One thing though. You have to make sure you'r password is correct, it's
case sentetive, so be sure you got it right. A good way to test if it's the
system you call, go to a normal terminal and dial manually. If you manage
to enter without problems, (using the same password), then Upoint got a
problem.

1892. Mac to Atari Help

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 10:38:41 UTC
From: E.D.Brown@lut.ac.uk
Message-ID: <E.D.Brown-3110941043110001@158.125.218.2>
Source record: 177567

This may sound like a strange request, I wonder if anyone can help.

I have recently inherited an ATARI ST 1040 with practically no software
and I have no experience of using it.

At work I use a MAC (Centris 650) with which I am able to access the
internet. My problem is the following, how do I download
shareware/freeware for the ATARI with my MAC and how do I convert between
the two disc formats so that I can use the software at home.

Any help appreciated as I am an absolute novice when it comes to the Atari.

Thanks,

Ed Brown

On Saturday October 29th at about twenty to five
boyd@math.fsu.edu (*Mickey Boyd*) happened to write:

Hi there!

MBB>a small board and new TOS chips. The newest TOS you could put in
MBB>with just chips is TOS 1.4. IMHO, neither is worth it, from a pure

There is one really big advantage of TOS-versions >= 1.04. It *dramatically*
improves harddisk performance!

When I got my first Mega 2 in '87 it was shipped with TOS 1.02 (Blitter-Tos)
and the blitter wasn't even installed yet. I got it a couple of weeks later ;-)

When the Megafile 30 arrived a little later, I installed TOS 1.04 and the
performance was way better than before.

If you're planning to get a HDD as well, a new TOS is definetely the way to
go. It doesn't *have* to be 2.06, although its desktop is kinda nice. And it
doesen't cost you the memory of loadable replacements.

MBB>(this is a religious issue with some, so expect some different opinions).

;-))

MBB>or NVDI

IMHO a *must have*! The new 3.01 is absolutely great. As were the prior
versions :-))

MBB>I have not heard a lot of good things about MTOS and regular ST
MBB>machines.

Don't even bother with MTOS on a 8mhz machine. It's soooo slow ...

1901. Re: Developing Mosaic for the Atari

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 13:08:19 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <392q83$o1s@mserv1.dl.ac.uk>
Source record: 178059

If this comes into existence this would be excellent news. All other major formats already have Mosaic (SUNS, PC's, Mac's, even the Amiga). This would really bridge the gap in communications software for the Atari.

I use Mosaic in work on the SUN's, and do feel you would have to take into consideration using higher resolutions on the ST and Falcon and TT graphics modes with colour support. Most people don't have more than 4 Mb on their Atari so you would have to squeeze everthing into that much RAM. MiNT and MultiTOS support would be nice but not if it impairs the speed to any large extent.

It would be good if it could use existing programs as external viewers, for example:

Gemview - Handles all pictures (would work on all Atari's)
MPEGPLAY v0.68 or MPEGDSP - Handle the playing of MPEG's (Only really suitable for the Falcon until more MPEG viewers come out)
There are various multi format sample players that can also be used.

It would be nice if a config file was included so you could tell it which external program to use if a particular type of file was encountered. If no external viewer was pointed to then it would not load the file.

These are just my thoughts, but it would be most welcome. For a system that works fully and is a ready to go system I would pay up to 30/40 pounds if the quality was there. I would like to perhaps try a Shareware version first, were people could submit comments before the product is released.

Best of luck,

Mark msh@dl.ac.uk

: fitting/splines/regression, the ability to point to an area on the graph
: with the mouse and have the program tell me what coordinates on the graph
: the pointer is. I tried GNUplot (from a.a.u.e) but it doesn't really run
: reliably on my system...

Try Euler, from a.a.u.e., in the Applications/Math (IIRC) directory.
Unfortunately, it doesn't output to any of the formats you mention,
although it will output to IMG IIRC. All of your other requirements are
fulfilled, though.

Pity you're not a Falcon or TT owner as it works a lot faster with an
copro and works very nicely in 1024x800x16.

ATB,

Martin

It's not just Atari users; it might be support in general. I've posted periodically on my experiences with Mark of the Unicorn, now that I've gone to Windows and bought one of their MIDI interfaces. Other r.m.m.s owners of the MIDI Express PC have had similar experiences to mine: they find problems with the gear, and MOTU show no interest in fixing them. Mark of the Unicorn simply do not appear to care about us.

I hope that Macintosh MOTU users are getting better treatment, because they sure aren't making friends in the PC and Atari markets.

> Personaly, I posted about 7 posts in both MOTU and Dr. T forums

I'm in a really tough spot, because I would like to retire my old ST completely, now that I'm using a Windows box for my sequencing software. But the Windows version of X-oR doesn't like my 6-cable MIDI interface, so I have to keep the ST going as an editor/librarian. I am not thrilled by Music Quest's editor/lib program, and I certainly don't want to support MOTU by buying Unisyn if and when it ever comes out for WIndows. I really hope that Emagic are going to make a Sound Surfer/Sound Diver version for Windows, because they haven't let me down yet.

Well, since it's now been a few years since I got rid of my ST, it's
probably time to get rid of the books, programs, etc. that I kept in case
I ever got another one ... If there's no manual listed, it's because I
couldn't find it after a hurricane and two moves 8^).
Here's the list:

Books -
original asking
Compute's Atari ST Volume 1: VDI $19.95 $10
Volume 2: AES $19.95 $10
Volume 3: TOS $24.95 $12
Abacus Atari ST Peeks & Pokes ..... $16.95 $ 8
Tricks & Tips $19.95 $10
Graphics & Sound $19.95 $10
Sybex Programmer's Guide to GEM $19.95 $10
Atari ST Basic Sourcebook (large format) offer
Atari ST Basic Sourcebook & Tutorial (small format) offer
Atart ST Owner's manual (dunno why I still have _this_ ...) offer

Mapping the Atari (8-bit) ..... $14.95 $ 7

Software -

Personal Pascal v2.? disks & manual ...? offer
Tackle Box ST & TB News 1&2 disks & lg. binder manual ...? offer
Prospero Pascal for GEM v2.151 disks and manuals ...? offer
FunctionZ function key labeling (disk only) ...? offer
PageStream 1.8 (disks only) ...? offer

Misc -
DeskCart (probably needs new battery), disk & manual ...? offer

1909. Slip and Popmail for the ST

Ok, I need a lot of help. I'm a long time atari user, but rather new
to slip (but not to internet).

I'm running an Atari ST with 2 disk drives and 1 meg of ram.

(OK, so I'm out of date...)

ANyway. Is there a slip program I can run? Popmail?

If so where to I get them and what do I need to make them work?

Also, what is MiNT? I'm really out of it on all the new ST stuff.

Thanks.

Hello,

For quite some time now I frequently use my Atari ST with 14k4 modem to
log in at the computers of our department. I read my news and mail on-line
and log off again. Since a week or so, my department offers a slip connection.
My question: what advantages does slip offer, compared with an 'ordinary'
serial link (just a vt100 terminal). If there are big advantages, I would
be interested in software to do slip on my ST. Where can I get it?

What's BlowUP Internal?! Wanna know more...

I have this MAG 17" Trinitron multisync .26mm monitor, and I'm desperately
seekin for some internal (= expasion slot) card, which could display
1024*768/800*600 -resolutions in 256 colours with over 50 Khz and over
70 Hz.

Does anybody know anything - are there any video cards coming for Falcon?

1912. Falcon Network options???

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 15:54:21 UTC
From: v_white@ece.wisc.edu
Message-ID: <3933vd$ojr@news.doit.wisc.edu>
Source record: 178075
Cross-posted to: comp.sys.atari.st,rec.music.makers.synth

Friends,

I purchased a striped down Falcon (1 Meg, no HD) a while
back, and am interested in networking it to a UNIX box, as
the UNIX box has enough memory for both system, and so there's
no real need to buy another HD if I can connect them.

In my case, the UNIX box has standard serial and ethernet
capabilities.

What options exits?
I've seen references to parallel to ethernet boxes.
Has anyone gotten them to work? Are these folks
satisfied with their performance?

What good is the LAN port?
Is there a favorite way to set it up? I'm not
to impressed with the Falcons documentation.
I've seen about zilch on it in c.s.a.s.

Any other methods I'm overlooking?

Thanks for any feedback, and if there's enough interest, I
can post a summary.

>
>Sam

Sam,
ExtenDOS Pro doesn't read the data from the audio CD, it just controls
the drive mechanism. So you need to get the sound either from the
headphone jack (I haven't seen a CD-ROM player without one), or from
a separate audio out connector (usually at the back of the drive).

FYI, _some_ drives support reading the audio CD data directly across
the SCSI interface. Most older drives do not. However, a future update
to ExtenDOS Pro will support reading audio data directly, on those drives
that allow it (& that I can test!).

For any problem with ExtenDOS or ExtenDOS Pro, please feel free to
contact me at r.burrows1@genie.geis.com.

I seem to recall a previous discussion where it transpired X assumed
'chunky' colour pixels. Of course the ST/F030/TT only have interleaved
pixels, except in HiColour and TrueColour modes on the F030/TT!

So any ST X terminal may have to be mono-only.

Can anyone confirm this?

Look for a file called "TODAY20A". Either "ZIP"ed or "LZH"ed. (I can't remember which.) GEnie has it, and it went out on the AtariNet about a year ago. _Supposedly_ it's in the Archives somewhere too, but I've no idea where. (Most Atari BBSs and Clubs have too, I'm told.)

Version 2.01 was released on 10/29/94, but all my attempts to send it out failed. (Hung hosts, hung systems, and a bizare crash to the desktop! Gee, ain't computers fun?!?)

1920. Re: CaTTamaran

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 17:02:46 UTC
From: oberle@informatik.uni-koblenz.de
Message-ID: <3937vm$7t9@newshost.uni-koblenz.de>
Source record: 178080

In article <CyIpEE.8xx@world.std.com>, azog@world.std.com (azog) writes:
|> Looking for anyone whos installed the CaTTamaran accelerator for the
|> TT, and wanted to get some ideas.
|>

...

|> Billy D'Augustine azog@world.std.com

Hi,

there has been a review in the latest issue of the german magazine
"ST-Computer". $100 really isn't a lot of money for this accelerator
(although here in Germany, it is 300 DM which - at the current ex.
rate would be $200).

On the other hand, the review clearly says that if you have an older
revision, the installation becomes quite tricky, and it is strongly
recommended to consult a professional service (which, of course,
isn't for free, too, so the low price becomes relative).

How much you can benefit from the board depends a lot on which application
you run. As only the CPU is accelerated and as there isn't any additional
cache memory included in the CaTTamaran, memory intensive applications
(e.g. TeX or GemView) hardly benefit from the accelerator (only 10-15%
performance increase).

It looks quite differently when it comes to programs like POVray
whose performance depends a lot on the pure CPU speed. CPU intensive
applications are accelerated up to about 30%.

I think you will hardly find an application which will run 1.5 times
faster, although this would be the theoretical speed up (48 MHz vs.
32 MHz). Every program needs more or less memory to run. And for
every memory access, the CaTTamaran has to _wait_.

In general, every clean GEM program won't have any difficulties when
run with the CaTTamaran. For critical applications, it is possible
to switch back to 32 MHz, which guarantees 100% compatibility with
a plain TT.

Just my impressions.

Bye,

Christoph

How good is the Canon BJC4000 color printer. I'm thinking of picking one up and want to know how it works with an ST. Any help would be appreciated.

Thanks
Bob

1923. Help Modems and word processors

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 17:31:15 UTC
From: lewis@laminar.ph.utexas.edu
Message-ID: <LEWIS.94Oct31113120@laminar.ph.utexas.edu>
Source record: 178043

HELP. I am new to this system so forgive me for repeating questions
that must have been asked several times.

I have an old color ST 1040 that I hardly ever use anymore but
I am now trying to get it to work with a modem. I need a good
terminal emulator program. I will use it to log in to a Silicon
Graphics workstation and need it to function like a termanial,
(really just a text terminal). the programs I have either
don't work at all (xmodem won't dial) OR do not scroll
and display things properly (vanterm does not scroll back and
does not display things properly but is almost usable-- it seems
mostly made to upload and down load programs.)

Does someone have a good public domain program they can send
me or tell me how to get. I managed to download a few programs
(storm, rufus135) from a WWW site but they are compressed. so could
someone send me a .lzh decompression program. I think I can get
them from this machine (the silicon graphics) to my Atari with
vanterm. I am willing to buy a program if that the best way to
go but I can't get anything locally so if there are recomandations
on what to get I'd apreaciate knowing where to get it.

Also I have been using first word plus. Is there some
better word processor I should use. I am told there are many but they
need a hard drive and more than one meg of memory. Is this true?
I need to print out spanish charecters on a panasonic kpx-1124.
Any advice? or program you can send me.

Please respond to me directly-- Its difcult and very time consuming for
me to get acesses to this users group (especially since I have only
one functioning hand for the next several weeks).
ANy Help would be greatly appreciated.

Thanks

Greg Lewis

I would like to see it be able to take advantage of the hardware its running off of. If this cant be done via the main program, maybe hooks into the program for the extra hardware on a Falcon/TT/Graphics card owners could later update via program modules.

Cant wait to see this up and running...

1926. Intel 14.4k modem problems

bjr2@Isis.MsState.Edu (Brian J. Roland) writes:

[about supporting ST resolutions in web browser]

>There is no reason to have a minimum resolution...
>There is no reason Atari ST Low Medium and High resolutions can't be
>practical as a web browser. It won't be as colourful...and it may require
>each picture to be in a gem type box for scrolling should it not fit entirely
>on the screen..but the modes can still make quite useable WEB browsers.

Although I doubt the usability of a web browser in 320x200 mode,
it seems to me that a web browser should run in that mode just to
allow ST users to see some colour. I consider it bad practice for
an application to come up with an alert box saying: ``sorry, I
don't run in this resolution''. This philosophy is also reflected
in the design of the Edith package. Of course, for a text editor
there is even more reason for it to be able to run in any resolution
(games development for example).

>I'd suggest that in writing Mosaic for the ST/STe/TT/Falcon line of
>computers...all video modes be supported.

I agree. Any GEM application should run in any video mode. That's
one of the basic requirements of platform independency.

>It seems the most practical way to do this is by making the entire program
>window intensive so pictures can be scrolled, and tucked neatly out of the
>way with a shrink icon when other desk top things need to be reached.
>There can be optional modes should you decide to take advantage of the
>ST 512 color modes, or STe hardware scrolling and blitter set up, that
>would pop that picture into the full screen non GEM mode required.

I don't agree here. In 320x200 mode, your only choice will be to
switch off the inlined images. I do think a 'shrink images by factor
1/n' option would be valuable.

>I know little about programing...but it seems to me the biggest problem
>faced is memory, and uncrunching the pictures at a reasonable speed.
>Are web pictures sent to Mosaic in a compressed format? Or do they
>just zip right in one pixle at a time? Is it vector graphics? How much

It is usually GIF. That can be handled efficiently even on an ST.
Most web browsers allow you to load the text first, while the images
come up later, either automatically or on command.

>Is it possible to do all this in one to four meg of RAM?
>Those are the only REAL problems I see...

If there's no room, you'll get the familiar 'there should be a picture
here' icons Mosaic normally gives you in case of problems.

>You might have to require well more than one meg of RAM to make
>this thing work. But there is no need to place a minimum graphics
>capibility on the program. I wouldn't care if the pictures were in
>Grey scale..or a bit blocky...so long as I could tell what they are,
>and it doesn't take 45 minutes to draw them.

The program may end up requiring 2 megs. But 2 megs should really
be sufficient. Of course we'll try and make it 1-meg compatible.

>Also...all of the multi tasking platforms I've researched claim to work
>with any program that doesn't break the TOS rules. Keep your code clean,
>and stay in touch with the folx that write these alteranate OS add ons,
>and all should be okay.

We all know this isn't true. Mainly because alternate OSs such as
Geneva are not GEM-clean themselves. This is mainly because there
exists no accurate description of precisely what GEM calls and the
AES are supposed to be doing.

>that ST medium and high should be supported - if possible.

Well, have a look at the Edith system. All dialogs fit on a 320x200
screen, mainly due to the use of a proportional Swiss font for text
fields. I see no reason why a web browser would need a screen wider
than 40 characters for its dialogs. A GEM dialog is always required
to fit within 40 characters. Creating larger ones (unless they are
sizable of course) is simply bad design practice.

>The way Mosaic works is this: it knows how to display/play certain file

The first version of the Atari browser will probably only support
'save as...' for unknown document types. Our priority is to get the
basic framework running first.

To create a table use '|' vertical bar/pipe to seperate the columns highlight the table and then use the menu option to open the dialogue to control heading lines and boxing etc.

To modify the ruler double click on it (for tabs click where you want the tab) to open the dialogue
for new tabs or changes to line spacing and alignment. Drag tab stops to new positions or off the ruler
to delete them.

Fonts are a proprietary format. The only source I know of was the ST-Review offer which ended a while
back. The cost seemed excessive given that the fonts could only be used with Calligrapher. Perhaps
contacting Go DIrect who handle the STReview offers or mail to streview@cix.compulink.co.uk may
be useful.

The original offer included an upgrade which added a fixed pitch font, a math font, a dictionary
and a thesaurus. They were worth having at the time.

I don't know about Protext 4.3 I have 5.5 but prop fonts are supported but only those built in to the
printer. Protext 6 supports scalable fonts but again only those built in to the printer.

I like Papyrus though the demo appears unable to apply a style to less than a whole paragraph. It
doesn't have the system font fast data entry mode that Calligrapher has. Still it can use Speedo GDOS/NVDI
for scalable fonts in easily obtained formats.

That would be nice, but it is not of top priority. What's most
important is that one can save everything that comes in to the local
hard disk, and then load it into viewers.

>It would be nice if a config file was included so you could tell it which external

This is a great idea! Someone could collect E-mail from everybody that
details their newsgroup suggestions, then tabulate the results and post
the "winners." If you don't want to do it, then I'd be glad to, because
IMHO, it certainly could do the Atari community some good by ending all
the tense discussion.

>left the stone age behind by now...

Why? Just tell me *WHY*? Config files are very handy. Just a plain ascii file which tells the system/app what to relate to. What's so stone age about that.

If we're talking stone age here, I'd say it's everything under ST-high resolution and packing everything into one app. I'm totally against that because if we're still supposed to develop optimally for owners of 1 meg STFM's running in med rez we're definately in the stone age. Mint has been out for years and there's no reason for not running it.

Nah, if you're out to develope a web client for the Atari series of computers, then do that and don't bother about making it the swiss knife of internet software. Others can do the telnet stuff and all that. Same for pictures etc. There are standard files a HTTP client should recognize and I don't see the reason why we should add a lot of stuff here just for the sake of doing it. There are plenty of viewers for sound and graphics. Just make them all standard GEM and better the communication between them.

Just my 2 cents (which isn't worth much now...). I'm very positive to the project and I will definately get the product when it's fininshed as long as it's not an overkill app which does a lot of things half assed instead of a few things very well.

There are advantages and disadvantages to using MiNTnet SLIP on an ST...

advantages:
- Using MiNT with some form of windows, (eg. Multi-AES as supplied with MultiTos, or MGR), you can have multiple telnet connections to remote hosts similtaneously.
- If you don't mind a bit of lag, you can run ftp in another window at the same time. Yes folks, it's acceptable even on a 14,4kb modem link!
- You don't need to use ftp on your department's computer, then zmodem to download to your ST; you ftp _directly_ to your ST from any host on the internet.

disadvantages:
- Needs lots of memory. With MiNT/MiNTnet/MiNTOS/MinixFs/modm0dev plus other drivers installed, I'm left with around 2.5meg available on a 4meg ST.
- You'll need to set up your file-system so that it looks and feels like it's BSD unix. This also helps when compiling network aware Unix applications.
- Disk space. All that extra software uses lots of disk space.
- It's not quite "plug-and-play". Expect to have to do a fair bit of mucking around to get a working system; it's not for the novice user.

There are probably other (dis)advantages but those will do for starters. I use SLIP almost exclusively now, but it has taken a couple of months to get a stable setup.

You just have to make up your own mind on whether you want to go for SLIP on the ST. If you do, you won't be disappointed, but be prepared for a lot of late nights and cups of coffee trying to configure it!

Cheers, Steve

Tos 1.0 and 1.2 were limited to 32,xxx sectors (due to a bug). With a
default size of 512 bytes per sector, that equals 16mb max partition size.
TOS 1.4 and beyond are limited to 64,xxx sectors, which yields a max of
32mb per partition, _if_ the default sector size is used. BGM partitions
use bigger sectors.

> BGM partitions use large logical sectors that allow partition sizes

> storage, and running non booted applications.

Ok, first of all, BGM partitions use some multiple of the standard size.
So, if one uses 1024 byte sectors, you can have up to a 64mb partition.
Using 2048 byte sectors, you can have 128mb partitions, and so on. This
is with TOS 1.4 or greater, as will be the rest of the examples.

You can have different sized BGM and normal partitions on the same disk,
with no problems. So, you could have a 16mb (normal) partition, a 64mb
(1024 byte sector) partition, and a 256mb (8192 bytes per sector, and
the max BGM partition size one can have, to my knowledge) all on one
disk.

The BGM standard is used by all current Atari hard drive software, so
ICD stuff and Atari AHDI will both work with this standard. You do not
need to use ICD hardware or software (it is fine stuff, just not necessary).
You can use BGM partitions with Supra hardware, given that you use some

newer software (like ICD Pro level, or AHDI).

BGM partitions are totally compatible with normal GEM partitions. It is NOT the case that they can only be used for storage. When the BGM standard was first introduced, there were a number of programs that didn't work with it (usually low-level hard drive utilities, like defraggers for instance). These have long since either aged out of existance, or have been update to properly ask the system for the current sector size. This is perhaps where folks get the idea that BGM partitions are not for general use. In fact, they are. You can boot off a BGM (another myth is that you cannot do this, probably due to a typo in the ICD manual, or an early bug or something). You can run programs from them. You can use them for whatever you want. All the latest hard drive utilities fully support them.

There is a gotcha with BGM partitions: You waste more space than with "normal" parititions. The smallest hunk of a disk that one can allocate is a cluster (uh, two sectors, I think). So, if you have a file that requires some number of clusters, plus one byte more, an entire cluster is wasted (minus the one byte) to complete the storage of the file. Obviously, if your sectors are bigger, your clusters are bigger, and thus you will waste more space on a BGM partition than on one with smaller sector sizes, on average. This is not a big deal. I would doubt that the difference is more than a few percent usage, unless you have a huge number of extremely tiny files (which would magnify the effect, just as a small number of huge files would shrink it).

In general, there is no reason to avoid using BGMs other than the small gotcha above. I usually format a disk from which I'll boot with a small GEM partition, then make the rest of it one big BGM. I do this out of habit more than anything else, and because I want the boot stuff to be localized to one place and not cluttering up my "work space".

1937. Can't reach second harddisk !

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 20:55:29 UTC
From: tletsch@sky.itr.ch
Message-ID: <393lk1$be5@sky.itr.ch>
Source record: 178099

After the installation of a second harddisk (a SH205) I can't use it through the GEM desktop on the Mega ST4.
I can reach it with Atari's HDX.PRG, i.e. I can format and partition it, but when I try to "Install Disk Drive..." on the desktop and then to use this drive, I get always a drive unknown error.

I would appreciate any pointers.

Thanks in advance,
Thomas tletsch@itr.ch

1938. [Q] Advice needed-comms prg/X-windows,UUCP etc.

Newsgroup: comp.sys.atari.st
Date: 1994-10-31 21:05:39 UTC
From: hallvart@ifi.uio.no
Message-ID: <393m73$c04@holmenkollen.ifi.uio.no>
Source record: 177982

I'm confused about all the telecomms stuff.
Right now I'm at the university using UNIX and X11 "X-windows",
which works great! But I will lose my account in a couple of
months time, and in order to access internet I have to get it
commercially (and pay for it)-:).

So, now while I'm here, having full Internet access for free, I want
to download the software I need for that.
I have no clue as to what software I need, and what "standard".
The terms UUCP, SLIP, QWK etc. doesn't tell me a thing.
What do I need?

I have tried connecting to the university via a modem with my STE, using
STorm, which works fine. I use my STE as a VT100 terminal to read my email
via EMACS and newsgroups via TIN. Only a single window though.

I have heard about offline-readers, which as far as I understand are programs
that download all the email and newsgroups (subscribed that is) and sends it to
my Atari so I can read the stuff after I have disconnected from the modem. Right?

What kind of program does that? Is Upoint light one of them? What about UUcico?

And about using several windows, I have heard about "UW.PRG". I tried it, but never
figured out how to use it, and one of the program files bombs out too. I also know
about "WINX" but I don't really know what these programs do.

What I want is the most flexible, user friendly setup possible for my Atari, so
I need some advice.
Thanks.

ASCII configuration files are stone age as nowadays any good application
provides dialog-based support for all of its configuration files.
Nobody wants to hack around in ASCII files (at least I'd rather not,
I just want an application to be self-contained).

>If we're talking stone age here, I'd say it's everything under ST-high
>resolution and packing everything into one app. I'm totally against that

Yes there is. Precisely because it is stone age too. It requires
lots of hacking around before it works (the most recent versions you
even need to compile yourself as binary distribution is not allowed).
Especially if you want things as MiNTnet.

And after days of hacking ASCII files all you have is a mtasking system
that makes a 030 run slightly slower than some of the 010 based HP 9000
systems of 7 years ago.

>Nah, if you're out to develope a web client for the Atari series of

>them all standard GEM and better the communication between them.

>Just my 2 cents (which isn't worth much now...). I'm very positive to the
>project and I will definately get the product when it's fininshed as long as
>it's not an overkill app which does a lot of things half assed instead of a
>few things very well.

My opinion is if you leave 'the telnet stuff' to other applications
(especially the flaky mintware currently around) *then* you will get a

system that will do a lot of things but all of the 'half assed'. Next you propose that we should call TOSWIN for such a session---this will really make me roll on the floor laughing. (See the thread 'TOSWIN - it's crap... it is!)

We will have to be able to handle many picture formats anyway when these are in-lined. If they're not, then a simple 'Save As...' option is a fairly universal solution for a first version of the browser.

As far as telnet is concerned, this is not essential for a web browser. One hardly encounters links to telnet sessions. Most important are http and ftp.

Better have one swiss knife in your pocket than two bags full of bottle openers, combs, kitchen knifes etc.

People buying Mosaic will want an application that runs out of the box. They don't want to spend the first 3 weeks Webbing around to get the entire MiNT distribution, Gnu C, MiNTnet etc., spend the next 3 weeks getting used to working with the Mintos system (you know, the masochistic one that never leaves the Auto folder...) the next 6 weeks to get these compiled, and finding out in the 13th week that it all sucks anyway.

(Wow. What a statement. But essentially I think it makes sense)

We are aiming at building an application people can buy and use. Nobody will pay 30 pounds for a package that will only run well after 5 other packages are installed.

DR-DOS has always been in a precarious position. Think what a "Look and Feel" court case againt it would do. OTOH I've heard that DR-DOS (recently renamed "Novell DOS") has been scrapped. Novell apparetly came to some sort of agreement (so I heard) over who did what in the market place.

FWIH the CaTTerman is a 48Mhz accelerator for the TT? I'm not sure I'd want to boast my 68030 up that far. It would seem that a much safer bet would have been the implementation of a secondary cache?

Roland.

I dnloaded version 2.00B, but I find some Big problems with it, it does not use GEM at all, also there is a command file, that uses very long Text lines, that I can't edit..

Also its no intended for the output to go to the screen, as there is no paging option, Big minus here...

Its needs a lot of work from what I can see, to bring it up to a decent Atari Gem standard, with out the need for a Text based command file....

Civilisation is very buggy, a friend of mine has spent months debugging
and improving it, do I have to say that he is crazy about the game?

Anyway, I know that TOS 2.05 has some bugs in it, that will make it
incompatible with some programs/games, and that is probably the reason
that TOS 2.06 has got such a bad reputation.
I'm using TOS 2.06 and have had almost no problem using programs and
playing games. (including Civ.)

Anyway, if he's really nuts about the game, he should try to change back
his TOS to version 1.6x again, most STEs are very easy to switch TOS's in!

There is a fantastic one called Chatmidi. It does split screen chat, file transfer and both at the same time! It also lets you look through the remote computer's drives and select any file you like and send it to yourself. It's a great person to person comms program.
Email me if you can't find it. Regards, Julian.

Ever wonder WHY there was never a case of Microsoft VS DR-DOS, as
regarding DR-DOS? DR-DOS is owned by Novell, but was previously
owned by Digital Research (who we all know well from GEM). Early
versions of MS-DOS were almost a blatent ripoff of CP/M. If you
examine some early MS-DOS manuals, see that _all_ of the 21 (?)
BDOS calls of CP/M are duplicated _exactly_ in MS-DOS. Considering
the implications, its a wonder that DR didnt sue Microsoft in
the first place! (and not vice-versa!)

>Donald McLaughlin
>dmclaugh@darwin.cc.nd.edu

There are slip programs you can run, but it will be really tight
on your system. One thing you could do (I played around with this on my
local university), if you have the ability to call into your provider
without actually initiating slip your set.

What I mean here is after you log into your system, try typing

connect wuarchive.wustl.edu

I doubt that you will conect to this, but if your provider tries
and gives you feedback instead of choking then your set. Go to your
support staff at your provider and ask them for the server you get your
mail through, it will probably be something like popmail@helios.nd.edu
(this is just a guess) Also ask them if they would be so nice as to give
you the .man file for popmail. Or alternatively you could find it yourself.

With this in hand you will then connect to your popmail server at
a one port to send mail and another to get mail. I don't remember off
the top of my head what these are, but they are listed in the man file.
So you will do something like the following:

connect popmail@helios.nd.edu 119 (your popmail server and the port)

then USER = your username
and PASS = your password

You should then get an acknowledgement of being in. Then play
with the commands from the man file. It is really fairly easy to do.
There are only a few commands and the output is human readable.

As far as MiNT Net on a 1 Mewg machine, I believe you can give up
on this. I got MultiTOS to run on a 1 meg machine one day (exercise in
wasting time) when I got done I could actually run a few programs.
Provided they were only 16k or so.

If you really want to try SLIP, I suggest you look in the
TCPIP.FAQ at atari.archive.umich.edu in Info/. It will give you a start.

Why can't the fileselector be placed in a window? And can something be done to
menu bar; the machine seems to (surprise ;-) freeze, while one is selecting
some pull-down menu entry. Well, I have a slow modem without any error
correction - and a fact is that I can't load or use _any_ other program in
parallel with my STalker 3 or Connect 2.42 while transferring files... One
timeout (easy to get) - and there you go... =-(
It's pretty frustrating.

> Outside is not software virtual memory, it utilises the PMMU in 020/030/040 etc. machines. Outside can`t run on a 68000 based machine.

Does anyone know, what has changed in Outside 3.3 compared to 3.2..? Version 3.2 didn't seem to like the combination Atari TT/32Mb FastRAM/4Mb ST-RAM/Matrix TC-1208/MatDigi 1/Calamus SL... Calamus didn't print with Outside =-(
On Falcon, Outside seems to work pretty well, although the 2 Mb it takes away from the Falcon ST-RAM, is a bit too much for some programs that want to have plenty of ST-RAM.

Is 3.3 worth upgrading..?

re. advantages of slip?

There are many different things that people will tell you are advantages to a SLIP connection. For an atari, I personally feel that the greatest advantage is just the fact that you are a site on the net (while your connected). So when you visit your favorite ftp site, you will get the files directly to your own machine. You bypass sz or kermit or whatever you use now. And if your really adventurous, you could allow someone onto your site if you have a file they want.

All this I understand, but am still vague on one point: am I using
a BGM partition? I am just mostly curious, as the above discussion
points out that I can use BGM partitions without much of a care in
the world (minus the minor fluke).

So I take my 250mb SCSI drive and partitioned it with HDX 5.mumble,
and use AHDI 6.mumble. Should I just ignore the low-level partitioning
stuff, and happily live out the rest of my life in bliss?

Source record: 178036

] Is it possible for me to make 16 bit samples on my Atari 1040STe?

You sure can. "Stereo Reply 16" will do 16-bit Stereo samples, at
up to about 35Khz.

] If so...can I get them into SDS (MMA Sample Dump Standard) format
] so I can send them via MIDI to my sample play back machines?

Erm... Probably. More than likely SDS is the standard SPL/SAM format.
(Sample with no identifier code, just the raw data).

A BGM partition is one larger than 32-megs, the usual GEM partition
being 32-megs or smaller. FWIW, a Spectre partition is called OOP.

I seem to recall mention of some such program for the ST, that would generate these "Stereo Gram" pictures. (Marketedin book-form as "Magic-Eye" pictures... In NZ at least). I was shown this on a PC earlier today, and actually managed to see the example picture in 3D and was quite impressed. I missed the result of the thread, is there a program that will work in ST-Low/ST-Medium, on a 2meg STE, that will generate these pictures, or convert other pictures into them?

These are the pictures that look like either black & white, or multi-colored static until you look at them in just the right way, and suddenly a 3D-image appears, looking almost holographic. Quite amazing! :)

> improves harddisk performance!

I cannot tell the difference between TOS 1.2 with FATSPEED installed (a tiny freeware auto folder program that fixes the crappy FAT lookup routines with nice zippy ones) and TOS 1.4 or greater (which has better FAT routines built-in). Without FATSPEED, I would definitely agree with you, but with it the difference is slight, if anything.

I love to see the look on people's faces when they first get FATSPEED and try it out on their hard drive :-). Total shock followed by a big grin. I knew about it from day one (thanks to comp.sys.atari.st), but I have run into several folks with old TOS and no FATSPEED that have been using a hard drive for years. Boy, were they surprised!

Please note that FATSPEED should not be used for TOS >=1.4, only 1.2 and 1.0 (in fact, I think it gives an error if you try it).

Hmmm, your original post stated that you are using a 250mb drive with one partition on it, so my guess is that you are in fact using a BGM partition. Well, actually I think AHDI calls it something different, but the structure is the same (larger logical sectors, same sector maximum).

However, this could be bogus, because I don't (yet) own a TT. My understanding is that devices hooked to the TT SCSI port use the same partition structure as those hooked to the DMA port, but I cannot positively state that.

> So I take my 250mb SCSI drive and partitioned it with HDX 5.mumble,

I'm rather biased about the ICD software. If I were in your shoes, I would purchase the ICD Pro level utilities in a heartbeat. The software is vastly better than AHDI, IMHO. However, I think your current state should be one of bliss, in general.

Oh, AHDI probably has some way of showing you "maximum logical sector size in system", or something like that. If this is greater than 512 bytes, you are using a BGM partition (or AHDI equivalent). For a 250mb partition, it should be 8192 bytes, I think.

This is pretty common with UK ST magazines (and other UK computer mags too).
Sometimes it coincides with the release of a new version (so they give
away version X, and give you the opportunity to upgrade to the new X+1 for
a fee). Sometimes they give away the software, then offer to sell you the
full manual set for a fee. Sometimes, they just give them away! In the
latter case, I guess the magazines manage to get ahold of the owners of
the rights to software from defunct companies and negociate a deal to
distribute this way (or they just buy the rights, er, outright).

I'm not an AHDI expert, but with the ICD software it is quite easy to forget
to turn the new partitions "on". They will not be visible from the
desktop until this is done. If AHDI has something similar, you might check
it (with the ICD stuff, you have to click on a little box next to each
partition so a checkmark appears, indicating that it is "on").

Yes! You can use Replay 16 from Microdeal and it supports MIDI sample dumps in a couple of formats but one catch is that they are only MONO samples, not stereo. Tho' I think you could cheat on that a bit and paste your way into a stereo sample. I have one I was going to sell (cause I bought a Falcon and don't need it anymore.) and I see you have the same service I do so if you're interested e-mail me and we'll talk.

1964. Supra Hard Drive For Sale

Newsgroup: comp.sys.atari.st

I have in the closet a working, but hardly used Supra hard drive. Here's the story: The case says 30 meg, but that maechanism died several years ago. I just recently got a rarely-used Miniscribe 20 meg from a Mac owner that I've put in there, an dit works just fine with the Supra host, and fits in the Supra case. I have no software or anything to go with it, so you're on your own there.

I'd like to get $40 for it, or make an offer. Thanks!

Rob

I would like to add a thought about the Shareware request that a Net user posted earlier. I am *against* a shareware version. I think that a polished professional product has a intrinsic value associated with it and is more alluring to possess. Shareware often -not always- has a 'Hack in the garage, work in progress' feel to it. I believe there is a market for application software in the ST world and with the emergence of the NET as a vehicle for the common man on the Information Superhighway, I foresee more ST users getting up and On-Line. Furthermore, a few good connections would get a review in one or several ST magazines that provide dependable feedback on the quality of a product for the masses.

Anyway, I guess I ran on, but I am trying to say...Go for the commercail version, I think it will be a more advantageous path to distribution of a Mosaic product.

Signed,

A new ST user on the NET.

Sorry, I should have explained that TODAYS was designed for BBS SysOps to run so they could present their users with a list of what happened today and upcomming events. Even in the latest version, there is _no_ GEM useage. Probably will never be one.

As for the "very long text lines", I never considered 80 columns long, but to each their own. Most of the lines I use are around 76 columns, because that's my editor's wrap point. It'll _handle_ 256 column lines, but you don't have to use them that long!

Personally, I run it at about 5:00 am running the report to a disk file, then use my editor to view it when I need to.

Sorry if I mis-led you.

Yes, the program you want is called STIS and is in the Atari Advantage database on Delphi for one. It works best in high res (it supports color, but is a LOT tougher to see the images.) You can make your own 3D pictures from Degas files. Pretty cool.

I was thinking about that one, too...

>seekin for some internal (= expasion slot) card, which could display
>1024*768/800*600 -resolutions in 256 colours with over 50 Khz and over
>70 Hz.

Hmmm. BlowUP is basically a 50MHz crystal with some wires :-). The
intenal version can be built into your Falcon (took me some time; it's
not too hard but you'll have to open your Falcon. If you've never
held a soldering iron before, go for the external version. That's
plug-n-play.) It gives you *complete* control over the resolution.
It comes down to `the more pixels, the lower refresh-rate'. BTW, it
doesn't occupy the expansion slot. You can get 1024*768 in over 100Hz
interlaced, but only in 16 colors. Some very fancy stuff too, like
nice scrolling virtual screens and instantaneaus SHIFT-ALT-HELP
resolution switching without rebooting. Know what? Check out the
demo on atari.archive.umich.edu. The authors can even be reached by
the net.

If you *really* want professional video though, you might want to
check if there's a `real' video card for the Falcon. I saw cards for
the Mega ST for 350DM that can give you 1024*768*256@70NI. Don't
think they come in Falcon versions, though.

When you have an accellerated Falcon, with a 20MHz bus, you can reach
even higher refresh rates/resolutions. You might want to check that
out. There's a Resolution enhancer/accelerator card that speeds up
your Falcon to 40 MHz, and gives higher resolutions too. But since
BlopUP gives me 50 MHz pixelclock, perhaps a combination of a 40MHz
speeder/20MHz busclock with my 50MHz BlopUP would *really* be amazing.

Does anybody have such a combination, BTW?

Hope this helped. How is that MAG? I'm pretty interested in one. I
have a 14" monitor now, but the letters get a bit small :-) The MAG

is double the price, though :-(

Regards,

Sander SToks

>
> Anyone know of any calendar programs that will fit the bill?

I have written a diary program called ST Diary. It emulates a page-a-day diary and shows two days on the screen at once. It uses one file per year and the user can have any number of files, however, only one year can be accessed at once. For recurring annual events, such as birthdays and aniverseries, there is a special file 'EVENTS.DAT' which is used in conjunction with the normal diary files. With enables annual events to be seen every year without using up increasing amounts of space. Each diary page holds 20 lines x 38 characters.

Version 1.6 is PD, and for those willing to register they will receive version 2.0 which also has an integrated address book.

Just a thought on Mosaic ... is it possible, do you think, to write some kind of Motif -> GEM convertor (either a source code translator, set of macros or libraries).

If so, then this would be quite a neat way to get Mosaic on the ST ... and indeed, other Motif progs as well.

Such a translator wouldn't attempt to copy the "look-and-feel", but say an open window function call would open a GEM window instead of a motif window.

The first problem I see (apart from examining all the Motif and possibly some X calls and convert them) is that X tends to work differerntly to GEM - ie. you write the functions and then setup a callback so when an action is performed (such as a mouse click, pull down menu option etc) then the corresponding function is called. I don't think GEM really works in that way (you tend to write a loop waiting for each event to happen).

Just a thought .....

>Does anyone know, what has changed in Outside 3.3 compared to 3.2..? Version

Changes were added to get the MinixFS working with OUTSIDE and one or two
minor bugs were fixed.

>3.2 didn't seem to like the combination Atari TT/32Mb FastRAM/4Mb ST-RAM/Matrix
>TC-1208/MatDigi 1/Calamus SL... Calamus didn't print with Outside =-(

The people of Adequate Systems, who write most of the modules for Calamus
SL, have a hardware combination like that and they use OUTSIDE without
problems. Don't forget to include CALAMUS in the list of programs that may
not be swapped out (see OUTSIDE manual for details).

>On Falcon, Outside seems to work pretty well, although the 2 Mb it takes away
>from the Falcon ST-RAM, is a bit too much for some programs that want to have
>plenty of ST-RAM.

In this case take away 1 or 1.5 MByte ST RAM. You can tell OUTSIDE how much
ST ram is to be converted to TT RAM. Programs that need plenty of ST RAM are
rare, BTW. Nearly all software runs in TT ram if you set the header bits
accordingly. A lot of people I know convert more than 2 MB ST RAM to virtual
RAM because they don't need this much ST RAM as all of their software is TT
compatible and thus runs in TT-RAM and virtual RAM, resp.

>Is 3.3 worth upgrading..?

BTW, the current version of OUTSIDE (still 3.3) includes the latest version
of the HDDRIVER hard disk driver, HDDRIVER 3.50.

MiNT-NET is a very good piece of code (although an install utility would help). You don't have to run MultiTOS AES to use it, just boot MiNT & run normal TOS. I tend to use MiNT + TOS4.02 + Winx most of the time - gives you the net support, long filenames, proper filesystem, but no slow down.

Craig.

From: CMOORE@wpo.csd.scarolina.edu
Message-ID: <CMOORE.85.000B3630@wpo.csd.scarolina.edu>
Source record: 177972

My friend and I were cleaning out one of his storage sheds this weekend. Amid the piles of Model Cars, Trains, and RC stuff, we found a Box O' Atari off in one corner. Upon opening the box we found an Atari 1200XL, 800XL, two cassette drives, a printer, and miscellanious cabling, etc.

Now, we both realize this stuff is OLD, but rather than leaving it in the shed to rediscover in a few years ("I claim this for Spain!" - Magellan), he would like to dispose of these items with someone who would be interested in them and who would give him a few bucks for the lot.

The plastic cases have the usual amount of fading one would expect on these old machines, but otherwise seem to be in good\reasonably decent shape. If anyone is seriously interested, please e-mail an offer and we'll pack these up nice and tight and COD it out to you.

Oh, and he also has a HUGE Apple Daisy Wheel printer (Centronics Interface) that, minus the dust and dirt on the outer case, is in great shape and runs fine, slow, and loud. Anyone interested?

'Preciate it.

Hmm, I think there's some confusion as to what I'm saying. Possibly
because my first post wasn't fully thought through. Now I have thought
it through, what I mean is this:-

1. Write an all-in-one WWW browser - that's definitely required.

2. If you've already written the SLIP/PPP code, why not release it as a
program that runs in a multi-tasking environment and provides anyone
who wants it with a socket to plug stuff like ftp, telnet and gopher
into?

The whole point of porting UUCP stuff to MiNT is to use the minix
filesystem though; linking (or sym-linking) files is much faster than
copying them, and minix filesystems don't die when you drop a couple
thousand small files into a directory...

Hallo!

I would like to have some opinions about using MiNT
with a "normal" Atari 1040 ST (4MB). I am quite aware
that MiNT is not UNIX; which UNIX features are present,
which important features does MiNT not have? How about
net features? How about GNU software under MiNT?

Thank you!

Ah. Annius, I guess we've encountered a misunderstanding here. I'm not talking about having to write the config file by hand - just about storing it in ASCII so that one can hack it by hand if one want to. Having a dialog interface to the config file is OK, I was more or less thinking about storing the information in the app itself.

>>If we're talking stone age here, I'd say it's everything under ST-high

My version of MTOS/MiNT didn't require one second of hacking to make it work. Atari has given their thumbs up for binary distribution of the upcoming version. MiNTnet requires a bit, but it should be possible to make an installer app for it.

>And after days of hacking ASCII files all you have is a mtasking system

Inlined viewables are expected to be either GIF or XBM. Just provede support
for transparent gifs and you're gold.

>As far as telnet is concerned, this is not essential for a web
>browser. One hardly encounters links to telnet sessions. Most
>important are http and ftp.

I was just mentioning it since others have been waving their hands and
screaming for it.

>Better have one swiss knife in your pocket than two bags full of
>bottle openers, combs, kitchen knifes etc.

Not if the swiss knife doesn't fit your pocket...

>People buying Mosaic will want an application that runs out of the
>box. They don't want to spend the first 3 weeks Webbing around to get
>the entire MiNT distribution, Gnu C, MiNTnet etc., spend the next 3
>weeks getting used to working with the Mintos system (you know, the
>masochistic one that never leaves the Auto folder...) the next 6 weeks
>to get these compiled, and finding out in the 13th week that it all sucks
>anyway.

>(Wow. What a statement. But essentially I think it makes sense)

Perhaps, apart from your time estimates... ;-) I get your picture, but you
really don't need that many apps to get things going.

>We are aiming at building an application people can buy and use.
>Nobody will pay 30 pounds for a package that will only run well after
>5 other packages are installed.

Define "well". 90% of what a Web client needs are done with the http, gopher
and ftp protocols and parsing and displaying HTML code, ASCII, GIF and XBM
pics and AIFF (or is it .au?) sounds. That should be in there anyway. What I'
m agains is all the other thingies whic others already have provided. How
many jpeg viewers do we need? Add GemView and you've covered most files
already.

Anyway, if you intend to make your own railway, make one that others can use
as well. What Im's saying is: if you think MiNTnet is such a beast, build a
better one. Maybe that will be the next standard which others will make apps
for. I'm so tired of everyone building their own railway to get to the same
station. It's the fonts thing all over again. *That* is stone age.

Yes, and it's called STIS. It should be available in most archive cites.
Works pretty nice, though I don't think it can output some of the work
that's available commercially.

>average. This is not a big deal. I would doubt that the difference is
>more than a few percent usage, unless you have a huge number of extremely
>tiny files (which would magnify the effect, just as a small number of
>huge files would shrink it).

I can assure you the difference is bigger than a few percentage:
i've made a 380 Mb partition om my new hard-drive, this paritition
uses 32768 bytes per sector (with 2 sectors per cluster).
I've stored many "normal" size files on it and here's what i've seen:
Bytes used: 220 xxx xxx, bytes free: 92 xxx xxx.
It represents 20 per cent of my storage capacity !
However i knew this would happen as i'm actually working on a new
hard-disk driver that uses it's own partitions (Called G32), and
works on it using 32 bits FATs, with this driver you can make huge
partitions (as big as 1024 Gigs and more ! -where can i find a cheap
disk drive to test my driver ?! :-)) With any size of sectors
from 512 to 262144 bytes), from 1 to 8 sectors per cluster...
The most important thing about this driver is that it will be very
FAST ! I may also include a real-time file-packing tool and get
rid of the 11 characters file limitation (and lower case !).
Some people might be scared by incompatibility problems but from
what i've seen only few low-level programs such as disk utilities
(defraggers...) unable to work. But, many programs are (or they
will soon be) compatible with that new 32 bit partition format.
Last good news: this driver will be a shareware !
For all developpers interrested: email me to get the last
documentation.

>Billy D'Augustine azog@world.std.com

It's even simpler than you think. You can modify a programs RSC file without ever needing to touch the original source code. The program reads the file in AFTER it has started running, not during compile time. But, make sure you stick with only changing text, not other items such as the number of menus available. THAT information IS read in at compile time, and unpredictable things WILL happen.

Yes, and yes.

Use Replay 16, you can sample and playback 16 bit (mono) samples on the
Atari, and you can send and receive SDS transfers with Replay 16 as well.

> a BGM partition?

Yes, if you have only one partition on your 250MB drive and used HDX to partition the drive, this will definitely be a BGM partition (HDX will use a clustersize of two logical sectors by default, so the sectorsize must be more than 512 bytes).

You can verify by looking at location 0x1c7 in the rootsector.

2006. Photochrome et al

Newsgroup: comp.sys.atari.st
Date: 1994-11-01 18:36:23 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <3961r7$t5n@mailer.fsu.edu>
Source record: 177974

I am curious about something. I noticed a blurb about Photochrome, in which it seems to indicate that this program can display pictures with higher resolution and/or a larger number of colors that are normally available with either the three standard ST/STE resolutions or the old Spectrum 512 method. I believe this can only happen on STE machines or above. Anyway, I was hoping someone could give me the scoop on this.

What programs out there can display pictures on a stock STE in the manner described above? Do they all use some sort of yucky interlaced method of doing this? I didn't realize that one could get such features with anything less than a TT/Falcon. I have a rather large collection of GIF/JPEG pictures on my Sun, but I have never bothered to try and look at them on my STE.

2007. for sale or trade

Newsgroup: comp.sys.atari.st
Date: 1994-11-01 18:42:24 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <39626g$t5n@mailer.fsu.edu>
Source record: 177975
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for joystick extension cables (preferably the short paired type, to defeat the ignorant location of the joystick ports on 520/1040ST), games, scanning equipment, Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review particularly), Pagestream 2.x font disks, and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

Oh, another thing I have particular interest in is a joystick similar to the standard Sega/Nintendo "joypad" thingies (left thumb controls movement via an 8-way "pad" rather than a stick, right thumb for fire button). I believe there is a joystick sold in the UK called a "Boolistik" or something similar that seems to be exactly what I am searching for. Let me know if you have one available, for trade or just some cash!

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers, includes a bunch of 150 and 300dpi fonts. Claims to be 200-500% faster than other HP drivers (for that time, I don't know if there are faster ones out now).

Image Cat, Wizworks, v1.0e, this program catalogs all kinds of image files (.img, .pi1, .pi2, .pi3, .pc1, .pc2, .pc3, .tny, .neo, Macpaint). It makes "summary" or "thumbnail" sheets which have the images on them (reduced), with file name and directory information. You just point it at a directory and it prints out the images. This is great

for DTP folks with a lot of clip art. Printer drivers for SLM804,
HP Desk/laserject, NEC LC890, Panasonic KX-P4450, Epson LQ and FX.

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is usable, though certainly not
state of the art.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting, lots
of weapons, little droids that follow you around and help you out,
big ugly aliens, etc. Great game.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Sidearms, Capcom, scrolling sideview shoot'em up, mouse controlled, lots
of weapons and powerups. Good "mindless destruction" game.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both
are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Eliminator, strange driving/shoot'em up game, lots of different weapons and
bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small
child (in terms of its difficulty). A bit boring for us big children,
IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics
are quite lame (mostly text, in fact), but I suppose a political
process fan might like it. It does not appear to be particularly
tied to the 1988 elections, and has data for US elections all the
way back to 1960. Can apparently be used to predict elections as
well.

****ST Action Magazines (with coverdisks)****

Issues available: 26, 43, 50, 51, 53, 54, 55, 56, 57.

These mags are great for game fans. The reviews help one avoid poor games and select good ones, plus there are cheats for the games, how-to-play guides, and useful non-game relaterd articles (hardware reviews, expansions, etc.). Also, they all have a "best ST games to date" list in them, which is a great way to select the "best of the best" when game shopping (for example, from discount houses who only list the names of the products, with no descriptions). Finally, the cover disks that come with the mags provide demos of games (so you can try before you buy), plus full PD/Shareware games and other software. Most come with two disks.

Also available: three ST Action binders, each will hold about 12-14 issues without any damage or modification (wire-in-the-middle style) and make it convenient to leaf through the mags. Sold/traded only as a group. These are well made, nice looking binders with the ST Action logo on them. Will hold any of the large format UK magazines (A4 size, I think).

No UNIX/POSIX fork(). MiNT's Pfork() blocks the parent untill the child
calls exit() or exec().
No asynchronous I/O. Your system will seem to be halted while you're
running expire and similar stuff.

> How about GNU software under MiNT?

95% compiles out of the box. Checking the Makefiles and config.h generated
by configure is always a good idea, allthough configure will get it right
most of the time.

If you plan to use the mintlib make sure you replace the bogus regex
stuff by GNU's regex. Their are some other bits and pieces you might
want to add/replace (the 4.4BSD libs will provide what you need).

2009. IBM Emulation (looking for Supercharger, AT Speed)

Newsgroup: comp.sys.atari.st
Date: 1994-11-01 19:03:59 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <CyLrMn.JGu@freenet.carleton.ca>
Source record: 177964

I've been calling around, trying to find the best/most finacially painless way to run some IBM prgs on my Mega STe. No one seems to have any info on the Vortex 386 SX card, other than that it is prone to blowing up! I talked to Compo's American office, and they told me that they were selling off all of their cards, that they no longer have any Mega Ste adapters, and that it never worked well anyway.

Will the Nec V30 in the old Supercharger run a fair bit of IBM software? What about Windows 3.1? (I don't really expect it to work, but I thought I'd ask!) Did the 286 card for the Supercharger ever see the light of day? What about expanding memory beyond 1 meg?

If anyone has any used IBM emulators that WILL work with the Mega Ste, I have a few things that I could trade. Cash is also an option, but not loads of it, as things are pretty tight on the homefront.

I have a 520 STFM (no mouse) that works fine, except it needs a new disk drive. I also have a HD disk drive that could be fitted in an ST/e, but that I have not ever used. I also have a medium Large Farmer John style wetsuit in good condition. Please respond in email. Thanks!

===> I just recently downloaded a GIF / PCS / PS1 etc. viewer from GEnie and I'm impressed, but still I'm lacking satisfaction. I have a craving for the kind of pictures I can get on my machine at school (256+color JPEG). So anybody know how to get greater than the 16 colors the STE allows at once? Do I need a different monitor (I have a SC1224). Do I need a graphics card of some kind? Any information/advice you can give will be greatly appreciated!

Does anyone in the South Bay (California) know of a source for inexpensive ST software? I used to go to Wierd Stuff, but they have pretty well closed out their ST stuff.

Thanks in advance.

2014. Obsession - What's the Deal?

Newsgroup: comp.sys.atari.st
Date: 1994-11-01 20:44:30 UTC
From: mgoodman@goody.demon.co.uk
Message-ID: <783722670snz@goody.demon.co.uk>
Source record: 177983

Anyone know just who is distributing Obsession.

I received a demo today from JCA Europe.
The label is marked:

Offical Demo - Please Copy & Distribute

One of the conditions in the readme says it may not be put on
any sort of cover disk until March 1995.

ST Review says it's on next months!

Whats the score?

Why reinvent the wheel? Adjust MagiC or MintNet for each other, and write an installation program for MintNet. If you do write own sockets; do it in a MintNet compatible way so that programs that works with MintNet works with the new sockets too. This way unix stuff is easy to port as well...

Hello everybody

For some reason mt Falcon won't let me alter the desktop configuration. Well, it won't let me alter the settings for the single key press thing anyway. For no apparent reason the settings for create folder and close directory have been changed but the rest are the same and no matter what I do I can't sort it out. I've tried altering the settings and then savings the desktop but when I reboot it's still the same.

Any ideas ?

I quite agree on that - even though some native code software would probably come out, too.. But why change the camp, when we have MC 68060..???
That thing is bloody fast, relatively cheap (some say..) especially compared to far too expensive 68040, and more or less compatible to current software.

Fortunately, Atari has no Windows, nor System 7 (well, I don't like Macs at all) to slow things down. Put MagiC OS into a 68060 Falcon - and there we have one quite nice computer, I think =-) !

I agree. And speaking of _support_, here's something to think about.
Updating programs can be slow, uncertain, and if one lives far away from
Germany, Britain or USA, it easily becomes expensive, too.

I think that the method some U.S companies use: put their update versions into
mailboxes and FTP sites, and use a simple updater-program, is G-R-E-A-T !!!

This way, almost anyone can keep up with the latest bug-fixes, etc. I _really_
hope that those software houses especially in Germany and Great Britain that
don't use this method, would learn from companies like Oregon Research (Diamond
Edge, etc) - and follow the same road.

Yes; they wouldn't be able to get that updating fee, like now. But I believe
that _FAR MORE_ people would bother updating their legal programs than now do.

How about it, HiSoft (Papyrus updater program?), Maxon (Outside, etc), DMC,
Digital Arts, ... Tell your comments, please - because I think that THIS is a
way you could improve your customer service A LOT !

A satisfied customer ==> More money to you in the long run.

And what do you users think ?? Do you want to update your programs by sending
disks somewhere, wondering how to pay DM 10,- in Swedish Kronor without having
to pay much extra for handling costs..?

Or do you support my idea?

Tommi

As far as I can tell, only using something like MultiTOS allows you
to get by the extereme limititations of the granted stupid 6 .acc
limit. I couldnt vouch for Geneva and the like.

on the other hand, a while ago, I got a hand of an accessory call
the chameleon (sp?). Basically it sits as the first (and only)
accessory on the system, but allows you to DYNAMICALLY update accessories;
ie no more reboots. Simply put all your .accs in a directory, and configure
chameleon, and off you go.

(but, I had some diffculties with it, that it would crash my system,
or do some other nasties. I cant be less vague, it was several years ago)

>Ian_Taylor@a2w.maus.de Hmmm, maybe time I had a new signature?

Yes I am in the same boat, some one sent me some file and the are all in PostScript...

I have been told that if you have a TT or better with 100 megs of Ram and 1 gig Hard Drive you can play with Gostscript, but you end up bald trying to get it to work, plus I think it does not supports Home type 9/24 pin printers...

To me the Atari computers all models, are comming to be a big joke, even to run SLIP you need some 10 programs when a PC clone can do it with just one Terminal Program that have every thing built in, fax/scanner and all...

They can't even use the CD disks that PC clones use...

I no longer tell people that ask, what computer that I use as they just snigger and think you must be stupid, or no nothing about computers to be using such a stupid machine...

Yes, it's called PLAYMPEG and is currently up to v0.68 (only runs on
VGA monitors -- for RGB monitors/TVs, you need to use v0.60 until
v0.70 comes out). The unregistered version only runs in greyscale,
but it uses the Falcon's DSP to get up to 20+fps playback. It can
be FTP'ed from archive.umich.edu in the atari/Falcon/Graphics
directory.

Does Multidesk or Multidesk Deluxe (from the Codeheads) work on the Falcon?
If so, that is the ideal solution for ACC collectors. It is not shareware,
but it is available for very cheap on the used market (I saw a forsale ad
that offered it for $5 earlier today).

Chris,

that may be true for the USA, but not for Europe (Central counting
in Switzerland of course) for the most part. And besides the Medusa System
is meant for people who wish to continue their professional work with the
Software they know, they use and they have everything on. Especially for
the Graphics (animation) and DTP Market.

2039. Trade PC for STE

>: advertized in ST Informer ($85)??

Another possible alternative is the 19" rack mount case made by Wiztronics. It comes with a heftier power supply, so you can mod your Falcon to your heart's content and not have to worry about smoke signals. It comes with a built-in adapter (I think) so that you can plug in an external IBM-type keyboard. The case also has a _fan_ and pass-throughs for all the standard Falcon ports. I think the price I saw at the Conn, Atari show was about $375. Call Wizztronics (I looked and it's 2 z's) at 516-473-2507 and ask for Steve Cohen. If I owned a Falcon I think I'd go for one. ;)

2041. WTB: IMAGE Cat, Current Version.

In article <199410301432.a16938@a2w.maus.de>, Ian_Taylor@a2w.maus.sub.org (Ian Taylor) writes:
>Graham Beint, 321 (graham@insignia.co.uk) wrote on 18.10.94:
>
>About printing postscript documents.
>
>Anyone know the path to a postscript viewer/converter for the STF?

Ghostscript 2.52 can handle all Postscript level 1 files which
are common to the adobe standard.
A port for Ghostscript 3.x which will support all PS level 2 additions
is still under construction.

If there are troubles using it (files not found) you should copy
all files of the distribution in one common directory.
For easier handling try to get GSview for the ST.

And now to Mr. Sheppard:

[some stuff deleted]
: Yes I am in the same boat, some one sent me some file and the are all
: in PostScript...

[flame on]
Aaahh. Interesting. Keine Ahnung haben aber gross die Klappe aufreissen!!
[flame off]

: you can play with Gostscript, but you end up bald
: trying to get it to work, plus I think it does not supports home type
: 9/24 pin printers...

This is not true. Ghostscript (2.52) works well and supports 9/24 pin
printers the same way like the Unix/Dos/MAC-Version.

: To me the Atari computers all models, are comming to be a big joke, even to
: run SLIP you need some 10 programs when a PC clone can do it with just one
: Terminal Program that have every thing built in, fax/scanner and all...

The second fault. On PC-Systems you need as well OSI-layer-supporting
socket drivers. Look for the software from FTP or Winsock or Novell ODI or
Mircosoft NDIS or ...
And this is no 'plug in and play' software!
The only exception is Linux. And the base system is robbed from better
machines. But that's the exception for use at home.

: They can't even use the CD disks that PC clones use...
Which are not compatible with the rest of the world! Very impressive!

SCSI-devicec used with the atari work well with MACs, SUNs, SGIs, all
the funny machines which are quiet better than a so called Standard-PC.
That for example PC-Users don't care about international standards (HTML) for
text browsing is another joke (Microsoft Windows is often called in German
Microschrott Windoof [get out yourself what it means]).
BTW: Microsoft is only able to copy good software from other programmers
in a buggy way.

: I no longer tell people that ask, what computer that I use as they just snigger
: and think you must be stupid, or no nothing about computers to be using such
: a stupid machine...
You do not mean a IBM compatible PC? Otherwise: ROTFL!

The stupid PC which isn't able to use it's memory in a straight forward
way is better? With a OS which only can handle up to 640 kB directly.
It's for laughing!

Dialogs do not block events. They prevent other applications from
writing to the screen, that's all.

Certainly not. But since Atari does no longer properly support TOS,
we need at least one OS that is up to date.

Ghostscript runs quite happily from my STe (4Mb) + 127Mb HD. You only need a few meg of disk for
fonts. GS2.6.1 and GS 3.01 are already set up for use with epsons both mono and colour. I use
them to drive a Swift 24e.

You may get a lateish version from HENSA. This is version 3.06. The
next version from that is 3.08, which is available on cix, which I will
download at the weekend, and put on hensa. I will announce it's
availablity here, when it is on-line.

> I just bough an STf for $25 (yes $25). First, what is this huge
>port/card interface thingee next to my Midi ports?

It's supposed to be a ROM cartridge port. I only know of two actual cartridges released for it, both now obsolete; however it is used for a few hardware expansions such as scanners.

> Second, how can I copy between IBM and ST?

Easiest way would be just on disc - they have the same floppy format (depending how old the ST is it may not format discs in a PC compatible way, but if you format on the PC they can both use it)

> Third, can I hook up a hard drive with IDE or ST-506 interface?

IDE - not easily, System Solutions sell an adapter for the mega ST which theoretically would work in the STF but problems of soldering it in and fitting it in the case mean it probably isn't worth it. ST506 you can do by getting a SCSI host adaptor and a drive controller, but the cost of the controller is such that you would be much better off just buying a SCSI drive.

> Fourth, are there any magazines for the ST?

I don't know about US ones, there are two glossies in the UK, of which ST Review is the best, and a subscription only mag called ST Applications.

>I just want an application to be self-contained).

There will still be a configuration file, and it makes things a lot easier if
it is ascii. I agree though that you should have a dialogue to set the options
in.

>Yes there is. Precisely because it is stone age too. It requires
>lots of hacking around before it works (the most recent versions you
>even need to compile yourself as binary distribution is not allowed).
>Especially if you want things as MiNTnet.

Hopefully MiNT 1.11 will be released as binary soon.

>it's crap... it is!)

No, we should have a GEM based telnet app, but using MiNTnet.

>People buying Mosaic will want an application that runs out of the
>box. They don't want to spend the first 3 weeks Webbing around to get
>the entire MiNT distribution, Gnu C, MiNTnet etc., spend the next 3
>weeks getting used to working with the Mintos system (you know, the
>masochistic one that never leaves the Auto folder...) the next 6 weeks
>to get these compiled, and finding out in the 13th week that it all sucks
>anyway.

I don't like mintnet either. But there is currently no alternative. If someone
comes up with a simple to install socket interface for the ST, then fine, use
that. But I would be against having it all built in as it limits you to that
one application, you can't have other programs such as newsreaders using the
same socket code; and because it limits you to SLIP, you can't extend it to
other network types by just installing a driver.

>We are aiming at building an application people can buy and use.
>Nobody will pay 30 pounds for a package that will only run well after
>5 other packages are installed.

It should be possible to produce a complete binary distribution of MiNT (well, when they finally allow binary distribution, hopefully not too far off), mintnet etc with an install routine.

As for the speed of MiNT, the slowdown is negligible and many functions are in fact faster. It's only the multi-AES that's slow and that should be much better.

>32mb per partition, _if_ the default sector size is used. BGM partitions
>use bigger sectors.

MSDOS also has this limitation BTW. Actually it's on the number of clusters
and MSDOS gets round it by using more sectors per cluster, which is a more
elegant way of doing it than big logical sectors as on the ST.

>> who want partitons larger than GEM allows, and I think this is an ICD
>> AdSCSI host thing. It might carry over to other SCSI hosts...dunno for
>> sure.

It was originally in AHDI 3. ICD adopted the same system.

Also...you can't boot from a BGM partition. It's strictly for
>> storage, and running non booted applications.

>use. In fact, they are. You can boot off a BGM (another myth is that
>you cannot do this, probably due to a typo in the ICD manual, or an early
>bug or something).

It says in the ICD manual that you can't, so I think that's where it came from.

>There is a gotcha with BGM partitions: You waste more space than with
>"normal" parititions. The smallest hunk of a disk that one can allocate is
>a cluster (uh, two sectors, I think). So, if you have a file that requires
>some number of clusters, plus one byte more, an entire cluster is wasted
>(minus the one byte) to complete the storage of the file.

To avoid this wastage, install MiNT and minixfs, then you can use 512 byte
allocation units for huge partitions.

Papyrus works fine on a 4Mb Falcon, which presumably has less free ram than a
4Mb ST. It even works, with lots of fonts, on a 4Mb ST with MultiTOS.

> Dana @ STReport International Online Magazine

I rather think that the purpose of putting an unsupported copy of Calligrapher on the cover disk was just a sales hook to try and get people to buy the fonts and PAKs.

The pricing of the offer was such that if you took up all of them you ended up paying the full price.

The font offers were particulary bad. The price breaks and time limit were fairly obviously designed to encourage you to buy the full set of 80 fonts for #2 each. This for a single use
proprietary format when commercial Speedo, Type 1 and Truetype fonts are available now on CD for less than #0.50 each.

I did get the flextext PAK the manual, dictionary and thesaurus but I will be probably switch
to Papyrus now that Speedo supports Type 1 fonts. (Note to HiSoft et al: Definitely if you provide
PostScript support.) Calligrapher is still worth having for the formulae creation facility built in.

Can't remember the exact prices but something like -

Calligrapher Manual & Dicts + (say 3) PAKs + 80 fonts #25 + #40 + #150 = #215
(Flextext #15, Indexer #10, Formula #15?)

Papyrus Upgrade offer + Speedo + 100 fonts #80 + #60 + #50 = #190
(less #50 if given the current upgrade offer.)

Plus the fonts can be used with other GDOS programs, where appropriate have complete families available and are in formats with a long future. With SGDOS 5.0 or NVDI 3 you have access to free fonts such as those given away on PC mag cover disks, the recent Type1's on

the late STUsers cover disks or the Indiana archive of PD fonts etc etc.

STReview were right to put Calligrapher on the cover disk but feel that they were less than fair to their
readers in not advising of the pros and cons of investing in the complete package. The other problem
is that the manual supplied had not been updated to reflect the version of Calligrapher on the cover disk.

>Why is a commercial program on a magazine cover disk????
Because Working Title dropped Calligrapher, so they use an offer via the
cover disk to get rid of remaining stocks (the program is on the cover disk,
extra modules, fonts, manuals were sold via an offer in the mag).

Geneva lets you load and unload (at any time) as many desk accessories as
you want (only limited by memory). Each accessory has full access to the
GEM environment. If you have more accessories than what would fit in the
left drop-down menu, scroll arrows will appear in the menu.

Not all these offers are legit. We got ripped off when a British magazine
decided to include our English version of Arabesque Pro without permission
(a program we were selling for $200). Needless to say, we lots plenty
because of that. Never saw a cent and it killed all sales of that program.
Hard enough to fight piracy when you have magazines doing the same thing.

>think they come in Falcon versions, though.

I haven't seen any Pro video cards for Falcon! Why is that? These
enchancer-dongles aren't enough for serious work.

>Hope this helped. How is that MAG? I'm pretty interested in one. I
>have a 14" monitor now, but the letters get a bit small :-) The MAG
>is double the price, though :-(

I use mainly 960x640x16, (Hor: 41.5 KHz /Ver: 62Hz) and it gives
very sharp image, and I you can work hours with it without getting
you eyes tired. But it gives a sharper picture the more HZ:s and
KHz:s you give it.

The electronics in it are not as good as in Nokia or Eizo (it
is difficult to get both sides excactly straight), but the Trinitron
tube makes you forget any complaints. The LCD display is great for
testing purposes. Also, it can be connected to two computers
at the same time, and the input switch is in the front panel.

Note that all Sony Trinitron-tubes have two vertical "stripes" (darker
lines) that go horizontally accoss the screen (1/3 -height). So if you see
them there, that's not a fault in the monitor (in a way it's a proof that
it really is a Sony tube!). I got used to those two stripes, and I seldom
notice them during work.

2077. TOS 1.62 -> TOS 2?

Newsgroup: comp.sys.atari.st
Date: 1994-11-02 14:41:30 UTC
From: mcsse2sw@dct.ac.uk
Message-ID: <1994Nov2.144130.1@dct.ac.uk>
Source record: 177884

I am contemplating upgrading my STe (TOS 1.62) to TOS 2.?? Has anyone out there done this type of upgrade? Does TOS 2 contain many bugs? Is it worth the money? A major problem with TOS 1.62 is you cannot set the system date to any year past 2000 AD. Can this be done on TOS 2? Do the switching devices which go between the old and the new operating systems hold both OSs in RAM at once thus limiting memory?

Any other comments would be much appreciated.

Sounds like the newdesk.inf file has become corrupted, there is a bug in TOS 4.01 that does this, and it can also happen if you use certain text editors on the file. Try deleteing it and building a new one from scratch.

! :>>I've heard some talk about a complete MiNT-distribution being released on CD
! :>>as well. With all the stuff needed for easy installation and even the whole
! :>>MintNet and sockets stuff.
!
! The CD contains just about everything MiNTy you could possibly imagine.

It has been brought to my attention that there are also some files of a dubious nature on the CD. Dubious enough to perhaps warrant a total recall and destruction of the CD. As of now this CD is no longer for sale. We are taking legal advice and hope to resolve the matter.

If anyone knows of a way to destroy part of a mastered CD, please get in touch with me at the address below.

Thanks in advance,

Simon.

2082. SpeedoGDOS 5.2

Newsgroup: comp.sys.atari.st
Date: 1994-11-02 15:54:27 UTC
From: mhsmith@ornews.intel.com
Message-ID: <398cnj$173@ornews.intel.com>
Source record: 177892

I was wondering if anyone has upgraded to this new version of
SpeedoGDOS. The latest STI indicates it is available now.

If anyone has, could you give us the 40,000 foot view of this package?
Specifically, can it use all truetype fonts (such as those found in
Windows) and, like Speedo 4.2 (??) do applications typically load
ALL the fonts into memory? Apps such as Atari Works takes an
excruciatingly long time (even with a very fast hard drive) when
lots of fonts are active in Speedo.

Thanks,

Michael

RG>What - on an *ordinary* ST?
RG>I know there was TT X-Server, but that was about it.
RG>Any more details on this new one?

Well, I mentioned the developers' adress in my previous mail, didn't I?

Some figures for the various models were stated in the article:

TT : 34.000 Xstones
STE: 10.000 Xstones
ST : 6.000 Xstones

No figures for the Falcon.

There are some different versions available. Prices range between 900,-- and
1.200,-- German Marks.

All versions support virtual screens and X11R5.

I agree with you there, Rick. A similar situation occurred with MichTron
BBS was included on a coverdisk a year or so ago. Tim Purves still owns
the rights to the program and he never authorized its use on the coverdisk.
The mag made its money on subsequent manual sales. Purves never saw a dime.

I missed the original posting, but a calendar/agenda program that's very good (imo) is CAL60 (not 100% sure about the number). It's a calendar, regular agenda and also supports recurring events, (like birthdays, 'paying the rent on the first monday of each month', 'make a hd-backup every friday', etc), cyclic events (do the dishes every 4 days :-), etc.
It comes with an auto-folder program that displays the upcoming events for the next X days (X is user configurable - even per event if you want) at startup.
Also supports event-priorities (some will be displayed at startup and some won't).

Oh, and it's an ACC of course. And no, I'm not the author, and neither get paid for the above :-)

Looked it up, and it's indeed CAL60.ACC (i.e. version 6.0)...

>in.

I see your point.

>Hopefully MiNT 1.11 will be released as binary soon.

Is there anyone who really believes it will ever be released? I don't
think Atari still care about TOS/MiNT at all. I suppose they have
realized that MTOS just isn't good, so what can they do? MiNT has
pretty much turned out to be the final stab for TOS. Obviously the
Macintosh-type multitasking would have had a much better effect...

>No, we should have a GEM based telnet app, but using MiNTnet.

Answer to that is simple: GEM + MiNT = go make yourself a cup of coffee

>I don't like mintnet either. But there is currently no alternative. If someone
>comes up with a simple to install socket interface for the ST, then fine, use

Why all those sockets? Atari systems are really simple things, mostly
single-user, so why not just grab that serial port and go ahead? I
don't see any need for sockets or similar stuff. How many people will
be running several net utilities at the same time? Only the MiNTnet
freaks, and they're already satisfied with Lynx. I'd rather aim for
the naive user who just wants a nice interface to the net...

>that. But I would be against having it all built in as it limits you to that
>one application, you can't have other programs such as newsreaders using the
>same socket code; and because it limits you to SLIP, you can't extend it to
>other network types by just installing a driver.

I don't believe there will ever be a substantial market for Atari +
something more sophisticated than SLIP. Let's be honest and admit that
Atari TOS is living in its final days (give it two years)...

>>We are aiming at building an application people can buy and use.
>>Nobody will pay 30 pounds for a package that will only run well after
>>5 other packages are installed.

>It should be possible to produce a complete binary distribution of MiNT (well,
>when they finally allow binary distribution, hopefully not too far off),
>mintnet etc with an install routine.

Hopefully is not good enough.

>As for the speed of MiNT, the slowdown is negligible and many functions are
>in fact faster. It's only the multi-AES that's slow and that should be much
>better.

Should isn't good enough. And applications supporting xfs become very
very slow even under single GEM + MiNT...

From: larserik@oslonett.no
Message-ID: <398j0h$ppt@hasle.oslonett.no>
Source record: 177921

I've been using the harddisk driver in SCSI-tools junior 6.02 for some while, but when I bought a SCSI-interfac I got SCSI-tools 6.06 full version and installed that harddisk driver instead. BUT the disk test both in the junior and full version says that the full version is slower:

Driver version:	SCSI-tools 6.06 full	SCSI-tools junior 6.02
Large block read:	749 K/sec - 750 K/sec	950 K/sec - 966 K/sec
Small block read:	204 K/sec - 204 K/sec	400 K/sec - 407 K/sec
Average seekrate:	22 ms - 24 ms	18 ms - 19 ms

I've tested several times with both drives and with both version's disk test routine, but the junior version is aways much faster !!! On small blocks it is almost TWICE as fast - Any explanation ????! In my opinion a full version should be faster than a small version

I don't know. One thing that skews ICD in my favor is that I can pick up
the phone and call them in times of weirdness. Also, software updates from
Genie/Compuserve are quite nice. Thus, the fact that I am in the states has
something to do with my recommendation (I believe the original poster is in
the US as well).

chainxor@kom.auc.dk (Henrik Lunardi Weide) writes:

>Is there a FTP site where I can find a binary of MiNT v.1.11 ???

Nope. Atari are restricting the distribution of MiNT versions > 0.95
to source only. DO NOT try to get a newer binary version of MiNT.
It is rumoured that Atari may allow distribution of MiNT 1.11 in
binary form in the (near?) future, but if they see binaries being
distributed before their time, Atari may decide not to lift the
restriction after all.

You either need to download the binary for MiNT 0.95 or buy MultiTOS
then grab the source for the latest version and compile it yourself.
Last time I looked, to get to v1.11 you need to download v1.10, plus
a _whole stack_ of patches to get to v1.11h2.

Since I never tried compiling MiNT under plain TOS, I don't know
if it's possible. I've seen reports that it will compile without
MinixFs, but I wouldn't want to try it personally. :)

Cheers, Steve

Date: 1994-11-02 18:11:47 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <398kp3$df7@mailer.fsu.edu>
Source record: 177807

Philips Dilworth Patton (darmok@leland.Stanford.EDU) wrote:
> Is there any shareware solution to get by the *idiotic* 6-accessory limit.
> (this is on a 14-meg Falcon).

I just remembered another one. Look for DC STuffer. I am pretty sure that it was shareware. Strangely enough, we don't seem to have it at atari.archive.umich.edu, so if you find it (and if it is in fact shareware or PD) please email me a copy. I seem to remember that it pushes the limit up to 32 ACCs.

<cringe> Reminds me of the old adage of a company coming out with a new
computer that fits on your wrist, runs rings around a cray, but the
first question people ask is "But does it run DOS?"

I can assure you that if I had a machine with a 68060 in it, I wouldn't
be running TOS/GEM on the thing!

Cheers, Steve

|all) to slow things down. Put MagiC OS into a 68060 Falcon - and there we have
|one quite nice computer, I think =-) !
|
|Tommi

And who in the world would buy it? The rest of the world demands a stable
software base on top of an operating system that is feature rich and reasonably
stable. TOS (or MagiC or whatever its called) still doesn't have long
filenames,
networking, decent user-interface capabilities, email support, etc. Customers
in the real world demand these sorts of features for their work/business.

What the hell good is a really fast piece of hardware that is hard to find, hard
to buy, and has NO SOFTWARE available for it?

Sure, the computer you described would probably sell to a couple hundred
hacker types throughout the world. That hardly makes a business case.

If you enjoy using the machine you have now.. great. Continue to enjoy it.
But if you think anyone else out there is going to put more money into
developing new Atari computers, you are wasting your time. There is no
money to be made there. The PC clones and lower price Macs have taken
any advantage that an Atari computer possibly had.

Don't get me wrong.. I am still jazzed about Atari. But I think they have a
good shot with the Jaguar machine. But, the computer products.. they
are dead.

Its time to wake up people.. Atari's computer products are now antiques.
Instead of finding Falcon and TT machines in your local dealer, you will
soon be able to find them at your local swap meets, garage sales, and

flea markets. The Atari ST computer line is following directly in the footsteps of its older realitives... The Commodore 64 and the Atari 800.

Welcome to the Past, folks. I hope you enjoy your stay here.

2110. Falcon Monitors (?)

Newsgroup: comp.sys.atari.st
Date: 1994-11-02 20:22:48 UTC
From: mipap@ars.ath.forthnet.gr
Message-ID: <01896ABKSWTAGKNNWXI@ars.ath.forthnet.gr>
Source record: 177927

IS>Hi. I would love to know exactly what the deal is with Flacon resolutions
IS>and monitor restrictions. Specifically:

IS>1) Can I get all resolutions on a SC1224 with the right cabling?

All the standard ones (listed on the desktop) plus with overscan.
That will take you to 768x480 useable with 65536 colors (very slow)
I use 16 colors on the above res for my everyday work with NVDI of
course at 60Hz. The flickering (on High res.) isn't so noticable.

IS>2) What good will my SM124 do? (none, probably)

On a standard falcon you'll get 640x400 monochrome. With Screenblaster
you can get bigger res. but still monochrome.

IS>3) I guess a MultiSync would be the best bet. Multisync VGA or SVGA?
IS> Or can I get a standard VGA or SVGA.

Multisync with Screenbaster. This is the right combination.

IS>4) How are the higher resolutions limited by certain monitors?

By the freq. they support. Of course if you have a standard falcon (
without Screenblaster or Blowup) all monitors produse 640x480 with 256
colors max.

Sorry for any mistakes in my writing.

2111. Support FPU's

Newsgroup: comp.sys.atari.st
Date: 1994-11-02 20:22:48 UTC
From: mipap@ars.ath.forthnet.gr
Message-ID: <01889ABKSWTAGKNNWXI@ars.ath.forthnet.gr>
Source record: 177928

I've recently added a FPU to my Falcon set up, so I searched for
programs that support it.
The only programs I found are CAD or Raytracing type...

On the other hand I see programs like GEMView or Imagecopy try to do
all the math with the processor. I am sure that a math routine that uses
the FPU will make the programs go faster.

SpeedoGDOS for example or NVDI 3 have scalers for vector fonts.
I'll bet they don't use FPU if it is available.
Why? Is so much trouble to add a FPU math routine? It makes the program
so big? Please I'd like to here some opinions on that subject...

>Thanks in advance.

In the South Bay there are 3 Atari stores if I'm not mistaken.
Haven't been to one of them in over 3+ years so I dont know if they are still
alive and open.

San Jose Computer
on Alma Ct. in San Jose near Spartan Stadium

Best Electronics
on The Alameda in San Jose near Santa Clara Univ.

BC Computervisions
on Kiefer in Sunnyvale/Santa Clara ... near Fry's Electronics, Weird Stuff, and
Price Club.

Also, there are a few in the East Bay near UC Berkeley as someone has already
mentioned in a follow-up.
They didn't mention Zephur/Micro-something on University Ave in Berkeley.
(though I heard there were legal problems and such with this store)

Hi Brain,

Hi Soft/AVR do a cartridge and software called replay 16, this will give you credible 16-bit sampling on an STe. As for the conversion, I doubt that the quality would justify it, i also believe that it would be very hard to do.

Cheers.

The Fonts are far to dear, and if you brought all the packs not including
the fonts you ended up paying 50% more that the Gold version price, so I think
this was a bit of a have....

I find its far cheaper to get the USA version from Codehead for $99, and I
think you get a extra font from them...

Try telling that to a demo. Don't forget that ST LOW on VGA monitor has
31 Khz horizontal instead of 15 that an RGB monitor uses.
Then some demo's use overscan. VGA monitors don't support overscan.

>than 40 characters for its dialogs. A GEM dialog is always required
>to fit within 40 characters. Creating larger ones (unless they are
>sizable of course) is simply bad design practice.

An interesting point-of-view. I kind of have mixed feelings about it.
On one side, good program design dictates that any program should work
adequately on all the permutations of the machine it's written on. And
on the other side, the flexibility of a program - and therefore it's
capabilities - could well be marred by programming for the lowet common
denominator.

That said, you needn't do either, or rather you can do both [g]. In
that, you can write code which takes advantage of all the features
available on the machines and ignores those features which are missing.
It just takes more effort on the part of the programmer.

>>has. So, if Annius does the same, Falcon people can, for example, use
>>one of the MPEG players to play back any downloaded MPEGS.
>
>The first version of the Atari browser will probably only support

>thus limiting memory?

>Any other comments would be much appreciated.

If youve got an STe of late vintage, chances are youve got a two-ROM
TOS, which makes installation a snap: pull the old, snap in the new,
and set a jumper.

I never did the two TOS thing, altho it looked rather easy. Apperently
a switch would bring in the address lines for one TOS, and bring out
the address line for the old, so only one TOS was in memory at once.
I dont have the schematic (anymore, or I just cant find it), but if
youre familiar with things, it should be easy.

Couldnt tell you about the 2000 AD thingy, I never tried it :-)

And not all offers are bogus either. In fact this is the only one I'm aware of in all the years that it's been done and the whole mag was withdrawn from the back issue lists because of it. I know that's no consolation to you since you got so badly burned because of it, but there you are.

In the case of Calligrapher, the authors dumped out on the Atari scene quite some while ago, preferring to do spreadsheets and stuff for PC's.

For most companies it's been a pretty useful outlet for getting shot of their old junk titles, clearing good but outdated stuff for far more than they'd have got if they kept it at full price and also giving an injection of interest for a product immediately before a major upgrade. The whole thing works both ways - 40ukp for the manuals for Arab_Pro was still pretty hefty and isn't a new version coming out soon too?

What effect it has on competitors titles that cover similar ground is open to question too, so it's also a good way of getting the users' attention but potentially damaging to commercial software in general.

Users are pretty happy about it over here, it goes without saying.

What's changed since v3.12 Uwe? That's the last version I got here in the
UK. I'm hoping for Sense Errors to be reported inthe same way that ICD
software does - also I got caught out when first installing it because it
didn't report that it hadn't found my drive due to the default being set
up for a different arrangement of ID numbers.

2127. New version of SuperSam - announcement!

Newsgroup: comp.sys.atari.st
Date: 1994-11-03 01:06:22 UTC
From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <Cyo32n.51A@exeter.ac.uk>
Source record: 177944

Well this should be in comp.sys.atari.announce by appears to have not
passed the moderator so it's going here...

```
**********************************************************************
** **
** S U P E R S A M **
** **
**********************************************************************
** The Superb Sample Editor v1.08 **
**********************************************************************
** A Terrosaur Systems Production for the Falcon030 **
** (C) Copyright 1994 by Daniel Hastings **
**********************************************************************
```

Yes, finally the new version of SuperSam is here!

It has been or soon will be uploaded to the following FTP sites:
ftp.uni-kl.de
ftp.cnam.fr
ftp.funet.fi
atari.archive.umich.edu
micros.hensa.ac.uk

It has been or soon will be uploaded to CIX and hatched into BBS file
echos.

Registered users of 1.01 can upgrade for free!

Main additions since version 1.01:

* Direct to disk recording, playback AND editing!
* Support for 16 bit mono samples!
* Support for virtual/alternative RAM!
* 4 new sample formats - DVS, AIFF, AIFC and 8SSP!
* Many improvements to the interface!
* Many bug fixes!

The SuperSam features list now includes:

* Handles 10 sample file formats - AVR, WAV, VOC, AU, IFF, SPL,
AIFF, AIFC, DVS and RAW!
* Handles 8 bit mono, 8 bit stereo, 16 bit mono
and 16 bit stereo samples
* Almost all operations can be performed direct to disk
* Clipboard cut, copy, load, paste, replace, overlay
* Ability to import/export from the GEM clipboard
* Ability to sign and unsign samples

* Ability to fade in/ fade out samples
* Ability to boost volume by 25% or to the max possible
* Ability to reduce volume by 25% or to zero
* Ability to zoom in for finer editing
* Flexible deleting
* Ability to swap the channels on a stereo sample
* Ability to pan the stereo image left to right or vice versa
* Ability to edit only the left or right stereo channel
* Ability to shift sample playback frequency
* Ability to create samples from the MIC input either to RAM or
direct to disk
* Supports all Falcon playback frequencies
* Customisable
* Can be installed as an application to play samples when they
are double clicked
* Will play or load a sample dropped on its desktop icon
* Online HELP system
* Batch conversion between all file formats
* Jukebox mode to play all samples in a folder
* Fully GEM legal programming
* MultiTOS compatible
* Supports virtual and alternative RAM
* Dynamic Memory Allocation

Contact Daniel Hastings at cs93dlh@dcs.ex.ac.uk for more details.

As you know, this wasn't a problem with the magazine involved (ST
Format) it was a problem between your UK distributors. I think it's
very unfair of you to suggest that it was in any way STF's fault.

I'd like to make it clear that I've never so much as written a word for
STF - unless you count a rather silly letter of mine they published in
'87.

Graeme

> how ???

Yes, many do - with aid of Backwards.. But some just don't: Sensible Soccer, Spindizzy Worlds, Flight of The Intruder, ... =-(

BTW: Is Backwards out of FTP-sites today? I haven't seen anything since 2.52 - and THAT is sad ;-(

Could someone owning it, upload it to UMICH, cnam.cnam.fr (great place), or into ftp.uni-kl.de ? Thanks!

BTW 2: Thanks for your Formula 1 GP comments in a different message. It isn't slow on falcon, no - but it was kinda depressing to see that the PC VGA (256 color) version runs as fast - on a 12 MHz 286 (!) .... Not much left to say, is there ? Sigh; a 68030-optimized version sure would be something.

I'd like to say: F&&& MicroProse for letting us down.. But by abandoning Atari users now, they hurt themselves. I won't buy their products in the future - even if I own some sexy Pentium 90 PC. Once betrayed, always bitter - but they don't seem to understand it. Or maybe they simply don't care a shit..

Business!

Pity.

Hi Joseph,

I've tried Captain's QWK. If you get a working version.. PUT IT TO THE TEST for awhile before registering. I tried it for a SHORT time.. but it bombs a fair bit for no reason! After reading a number of messages.

Have you tried Mountain Reader II? I'm using it right now, and its great. I havn't had one thing act wierd on this one at all. The author has been good, when I asked questions as well. Its on sale right now, registration is $20.00 US.. normally $40.

Brian...

: Any ideas ?

The Newdesk.inf file is easily corruptible. If you have edited it with a text editor that is the problem. There must be a specific number of spaces after each line.

If you use a boot manager then you may be changing the wrong Newdesk.inf file. The one in the root directory is not necessarily the one that loads.

Try deleting the Newdesk.inf file just before you save it. I think the save function appends to the old Newdesk.inf file.

BTW, this same problem gave me headaches for months.

Sam

OK-

What cables are you guys using to hook up all these monitors? I looked in the TOAD catalog and their adapter states that you nedd a multisync capable of displaying 15.75KHz horizontal. What do they mean by that? Is that for ST resolutions only?

Also, can an ST program be run in a higher resolution on a Falcon? Can a Falcon program be run in several resolutions. (i.e. does the graphics operating system adjust this independent of the program?).

Thanx!

The 68882 is pin-compatible with the 68881. If you have an 882 handy, plug
it on in, it'll work the same as the 881. For the most part it is software
comaptible too, just that it can execute 2 operations at once while the 881
can only do 1 at a time.

: the address line for the old, so only one TOS was in memory at once.
: I dont have the schematic (anymore, or I just cant find it), but if
: youre familiar with things, it should be easy.

Double-TOS's is really quite easy.
Here is how to do!
Normal TOS 1.62 comes on 128 kb EPROMS (2*128=256kb), while TOS 2.0x
comes on 256kb EPROMS (2*256=512kb).
To get both TOS's into one set of EPROMS, you need 512kb EPROMS, and burn
TOS 1.62 in the upper half of each EPROM, and 2.06 in the lower half (or
vice versa of course).
Then you extract the highest adress-pin on each EPROM, and connect a
switch to it. Voila! Yuo can now switch between TOS 1.62 and 2.06!

Parts needed for this is 2 EPROMS (27C020) and a switch.

But a warning is in place here...
DO NOT SWITCH TOS WHILE YOUR STE IS RUNNING!

So a small circuit that prohibits TOS-switching while the computer is
running is in order.

I really recommend getting TOS 2.06, I've installed it in my STE, and I
haven't found a program worth having that didn't work on TOS 2.06.
(But I did find a few that didn't run on TOS 2.05)
You get a TOS with a lot more features that is esential in my opinion if
you intend to use your computer for other things than playing games.

Mentioning a few, you get the drag&drop protocol and keyboard shortcuts.
Both of which I consider more important than whisky!

And while you're at it, get a WINX modified TOS 2.06!

Regards, Tommy

2144. ATARI CDROM FAQ

Newsgroup: comp.sys.atari.st
Date: 1994-11-03 07:36:54 UTC
From: brarda@vxclia.cern.ch
Message-ID: <brarda-031194083506@128.141.55.218>
Source record: 177883

Feel free to mail me for all the errors you see (in the contents and also
in the form because I am French and the English language if no my first
one) or for other information that can be interesting.

You can find all the PD or shareware programs for CD-ROMs at ftp.cnam.fr in
the directory : /pub/atari/cd-rom

Loic

New since last version :
- ISO-FS
- AudioStreams
- CD-Tools Jr
- WinRec 1.4 and WinRec Pro
- MusicChannel 1.51
- Demo Mania CD
- Whiteline Alpha CD

ATARI CD-ROM FAQ

31/10/1994

0 - Contents
1 - What driver should I use with my Atari system ?
2 - What discs are available ?
3 - Can I use Photo-CD on my Atari ?
4 - Can I play Audio-CDs on my Atari ?
5 - How do I program the CD-ROM drive ?
6 - Appendix A : User's configurations

1 - What driver should I use with my Atari system ?

There are several drivers available :

MetaDos :
Free software from Atari Corp.
Available from atari.archive.umich or ftp.muenster.de (metads24.zip)

The filesystem drivers support ISO9660 and High Sierra CDs, but not
multisession CDs.
The device driver only works for the Atari CDAR504 connected to the
ACSI bus or with generic SCSI CD-ROMs connected to the TT SCSI port.
(Answer from Julian Reschke)

CDROM.XFS :
Free software (Copyright 1992,1993,1994 Eric R. Smith, Michael Bernards

u. Gunther Leis)
Available from atari.archive.umich and other ftp sites.

This driver is a Mint extended filesystem and works on TTs and Falcons.
CDROM.XFS version <0.7 does not work with Mint/Multitos > 1.04.
The current version (0.7) is said to work on Mint/Multitos > 1.04.
It seems to be true on TTs but it does not work with any Mint version
on my Falcon.

CD-Tools :
Commercial solution from Hard & Soft, Obere Muensterstrasse 33-35,
D-44575 Castrop-Rauxel, Germany, Phone: ++49 2305 18014, Fax: ++49 2305
32463

Includes MetaDOS with GEM-based installation program, audio player with
PCM audio data import (only some drives) and custom devices and
filesystem drivers (support for Atari CDAR504 and generic CD-ROMs
connected to ACSI through host adapter, TT-SCSI, Falcon-SCSI,
multisession support (only some drives)).
(Answer from Julian Reschke)

With CD-Tools, you also have a GDPS module and the program Scan-It that
can handle Photo-CD Pictures.
CD-Tools is in German and costs 99 DM.

CD-Tool jr :
Commercial solution from Hard & Soft

CD-Tools without digital audio copy, GDPS and Scan-It.
CD-Tool jr costs 49 DM.

ExtenDOS v1.21:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa,
Ontario K1V 0B8, Canada.
Available in UK : System Solutions.

Support ST, STe, Mega, TT, and Falcon. Read ISO9660 and High_Sierra
CD-ROMs. It now runs just fine under MultiTOS with no restrictions;
memory protect is OK, and you can run programs directly from CD. It
also runs fine with Mag!X 2.01, with the restriction that the
EXTENDOS.CNF file must be in the root directory.
Support for Multisession Photo-CDs (with Multisession drives).
Configurable cache.

The next update will have an installation/setup program, plus support
for more drives.

Extendos v1.21 costs $29.95(North America).
(Information updated by Roger Burrows / Anodyne Software)

ExtenDOS Pro:
Commercial solution from Anodyne Software, 6 Cobbler Court, Ottawa,
Ontario K1V 0B8, Canada.
Available in UK : System Solutions.

Like ExtenDOS 1.21 with audio support.

Extendos Pro costs $39.95(North America).

F030_CD :
Fairware from Peter Hilbring, Dietrich Ottmar Stra�e 16, 59597
Erwitte, Germany
Available on ftp.tu-clausthal.de
(/pub/atari/falcon/systools/f030_cd.zip)

This package includes a BOS driver for MetaDOS, MetaDOS 2.3, a
low level SCSI driver (TT & FALCON) and a program named
cd_explorer as exemple of the access of the low level driver.
(Info from Vincent Lefevre)

I�ve just tried these drivers on my falcon with an Apple
CD-300 cdrom and it works without problem.

ICD Pro :
Old versions came with a MetaDOS driver named ICDCDROM.BOS.
The new ones comes with a mint extended filesystem.

Egon CD-Utilities :
Commercial solution from EDV-Service Bontenackels (Germany);
Fax : 02405-74369
Available from several german shops (Ex.: Softhansa Gmbh, Untersbergstr.
22,
81539 Munchen, Tel : 089/6972206, Fax : 6924830)

Multisession MetaDos driver with audio-CD player.
Works with ST(E)/TT/Falcon.
ISO9660 and High Sierra.
Program and CPX for Audio Play.
Audio track to Hard Drive copy in AVR or DVS format.
Support of the Pure C Metados Library.

Egon CD-Utilities costs 79 DM.

If you have some experience with this new driver, mail me.

CD-ROM ROM:
FromCompo (Tel.: Germany : 030-623 82 92; Holland : 04454-6 38 88;
Switzerland : 01-784 89 47; France : 1-47 35 89 66; UK : 0487-35 82;
USA : 415-35 50 862)

It�s a Driver plus an interface witch can go in the cartridge port of
every Atari computer and can handle IDE CD-ROM drives.

In Germany, CD-ROM ROM costs 150 DM.

ISO_FS :
From Erling Henanger <erlingh@idt.unit.no>

This new Mint/Multitos CD-ROM driver will be released as shareware as
soon

as mint 1.11 is released.
- FAST
- Supports several mounted CDrom drives.
(ie. CD-shifters or just more than one drive)
- Works on Falcon and TT scsi + acsi.
- Supports rock-ridge extensions (Long filenames on CD-roms that
are made with this in mind - like the GNU/X11 CD-rom)
- Is made ready to do disk-transfers in the background as soon as
mint is up to it.
It comes in two parts :
- A generic scsi/acsi driver that talks to the
hardware.(scsi.xdd/acsi.xdd)
- The filesystem itself.(isofs.xfs)
In addition it comes with a GEM based configuration program.
Limitations:
- It needs mint.prg with a version number >= 1.08

2 - What discs are available ?

There are five Atari specific CD-ROMs :

GEMini CD-ROM :
From Walnut Creek CDROM, Suite 260, 1547 Palos Verdes Mall, Walnut
Creek, CA 94596, USA, Phone: +1 510 674-0783, Fax: +1 510 674-0821,
Email: info@cdrom.com, Ftp: ftp.cdrom.com
Available in Germany from Ingenieurburo Praefcke, Holtzvogtkamp 55,
24220 Flintbeck, Phone: (04347) 7531.

You can find the index of the GEMini CD-ROM on atari.archive.umich.edu.

Bernd Lohrum CD-ROM :
From Bernd Lohrum, Schlossbergstrasse 36, D-66440 Blieskastel, Germany,
Phone: (0171) 4210222

There are two CDs from Bernd Lohrum :
Drachenstarke software : 300 Mb
Tigerstarke software : 500 Mb

Each CD-ROM costs 69 DM (59 DM for MAUS net users).

Wohlfahrtstatter CD-ROM :
From Wohlfahrtstatter, Irenenstr. 76c, D-40468 Dusseldorf, Germany,
Phone: (0211)429876.
This CD-ROM costs 89 DM.

Power CD Volume 1 :
From Compo.
This CD-ROM costs 79 DM.

Atari Mega Archive :
From Systems Solutions, Brandt Fernandes (Europe) Ltd, The Desktop
Centre,
17-19 Blackwater St., London SE22 8RS., England;

Tel.: +44 181 693 3355; Fax : +44 181 693 6936;
Email : rperry@cix.compulink.co.uk or gdrayson@cix.compulink.co.uk

This CD is composed of the vast majority of the Atari archive at
umich.edu.
The only things missing are the 8bit section and the GNU minix tools
(whose
filenames are difficult to convert to 8.3 format). The disk contains
some
480Mb of compressed programs, and a further ~115Mb of .mod files which
(hopefully) can be played direct from the CD.

The CD cost 29 pounds (with VAT & Posting). Systems Solutions can take
credit
cards etc. which ought to make things easier for you lot, and they're
used to
importing/exporting, so they're more likely to get it right.

(Text taken from the announce on a.a.u.e)

Two other CDs will come out soon :
- Demo Mania CD from Akzente Computer, FrauenStrasse 40, 890783 ULM,
Germany
Demonstration versions of commercial software.
Costs 19.95 DM.
- Whiteline Alpha CD from Delta Labs Software, Rembrandtstrasse 1,
42329 Wuppertal, Gertmany
Sharewares and PD, 500 TrueType fonts, Atari Linux.
Costs 79 DM.

You can also use all the ISO-9660 CDs that exists for the PCs. You won't
run the PC programs but you will access all the text, pictures, and sound
files on it.
The discs already tried are :

Corel Artshow 91 :
~ 1000 scans of paintings (like Manet, Van Gogh,) in 16 and 256
colors PCX files;
All the images from the 91 Corel draw contest in CDR and DIB format;
some midi files.
The PCX and DIB files can be read with Dieter Fiebelkorn's Gem-View
3.xx .

Source Code CD-ROM (Walnut Creek):
660 Mb of program source for MSDOS, windows and Unix.
The March 94 version does not contains the COMP.SYS.ATARI.SOURCES any
more.

Compo sells a cd-rom from Bitstream with 500 Type 1 and True Type Fonts
for 99 DM. Looks great for Speedo-GDOS v5 and NVDI 3.0 owners.

Clipart Warehouse

Compton's New Media M.O.S.T. CD-Roms :
Doctor's Book of Home Remedies
KGB-CIA World Fact Book
The Pill Book
The King James Bible
U.S. Presidents

You can view all these M.O.S.T. CDs with Brian Grier Perkp's
program. (MOST.ZIP, the demo version is on ftp at
Atari.archive.umich.edu).

3 - Can I use Photo-CD on my Atari ?

Of course You can !
To have full use of the photo-cds, you'll need a multi-sessions drive and
driver and also a program that can handle PCD files.

CD-TOOLS :
The driver from Hard & Soft can read multi-sessions discs and have all
the needed stuff to handle the Photo-CDs.

ColorDisc PCD :
Commercial software from Color Concept, Im Alten Breidt 4, D-53797
Lohmar Breidt, Germany, Phone: (02246) 7132

This program allows you to manipulate the photos on your Photo-CDs, and
save them on hard-disc. It handles Portfolio CDs.
If my understanding is good, it works with metados and a special BOS
file (both included).
It also includes a CD-Audio player.

A demo version is available at ftp.tu-clausthal.de.
ColorDisc PCD works on TTs and Falcons and costs 99 DM.

Studio Photo :
Commercial software from Eurosoft.
This french program can manipulate Photo-CDs.

Gemview v3.xx :
Shareware from Dieter Fiebelkorn, Gr'ner Weg 29a, W4370 Marl-Brassert,
Germany, Email : fiebelko@bonny.informatik.uni-dortmund.de

Gemview is also capable of handling PhotoCD's. Only in two resolutions
(Base and Base/4 I think)
The Gemview v3.xx license costs 40 DM.

4 - Can I play Audio-CDs on my Atari ?

Of course You can !

The following programs are available :

CD-TOOLS :
The driver from Hard & Soft includes a player for CD-Audio discs. The
drive must understand SCSI2 instructions(Or CDAR504 or the Apple

CD150).

ColorDisc PCD :
It also includes an audio Player.

Audio CD Master 3.0 :
Commercial software from It's All Relative Software, 2233 Keeven Lane,
Florissant, MO 63031, USA.

This program can play CD-Audio discs on SCSI2 and Nec drives. On
falcon and with some drives, it allows you to control and pipe your CD
audio sound into the Falcon for DSP effects using software like the
Audio Fun Machine that comes with your Falcon 030.

Audio CD Master 3.0 costs $29.99 US, postpaid, worldwide.

Audio CD player 2.0 :
Older shareware version of Audio CD Master 3.0 from Nima Montaser, P.O.
Box 52127, Ottawa, Ont. K1N 5S0, Canada

Does not work on my falcon.

Egon CD-Utilities :
This package contains a program and a CPX for CD-Audio Play and allow
the
copy of the audio tracks to the hard drive.

ExtenDos Pro :
This driver contains a program to play CD-Audio.

AudioStreams:
From Erling Henanger <erlingh@idt.unit.no>

- Includes a CD-database that will recognize CDs and favourite
tracks.
- Works as program or accessory, with or without mint/multiTOS.
- Works on TT and Falcon scsi ports.
- Should work on ST's with ICD's SCSI-2 capable host interface, but
this is not tested.
- Works on all SCSI 2 compatible CD ROM drives, as well as Pioneer
and AppleCD 150 drives. Can be configured to work with any CD ROM
device through external drivers. Drivers can be made with a
supplied compiler program. They are made from simple ASCII files,
and example files are included for SCSI 2 and AppleCD.

WinRec 1.4 et Winrec Pro:
From Andreas Binner, Eichholzstrasse 12, 90587 Veitsbronn, Germany
Email : andreas_binner@n.maus.de

Winrec 1.4 is a shareware and Winrec Pro is the commercial version with
more functions. The main function is direct_to_disk.
They now containsan CD-AUDIO player that works with MetaDos.
The Winrec 1.4 license costs 30 DM.
Winrec Pro costs 129 DM.

MusicChannel 1.51:
Shareware from Stephan Bold, Paray-le-Monialstr. 16, 67098 Bad D�rkheim,
Germany; Email : stephan_bold@lu.maus.de

CD-AUDIO player and �.MOD� selector.
Works with MetaDos and Paula.
Also contains a CD-AUDIO database.
The MusicChannel 1.51 license costs 10 DM.

5 - How do I program the CD-ROM drive ?

Some bindings exists to access the cd-rom drive. They can be found on
ftp.muenster.de (under \pub\atari\Programming\CDBIND01.ZIP).
They can be only used with some drivers (CD-TOOLS and ExtenDOS can be used,
CDROM.XFS not).

6 - Appendix A

These are some users configurations :

TT, MultiTOS 1.04, CDROM.XFS
TT, MultiTOS 1.08/9, CDROM.XFS v.0.7
TT, MetaDOS

These do not work:

TT, MultiTOS 1.08/9, CDROM.XFS < 0.7
TT, MultiTOS, MetaDOS

Drive : NEC Multispin, external (84-1).

Discs : GEMini Atari CD ROM from Walnut Creek
Clipart Warehouse

MSTE -> ICD MicroSCSI -> ICD AdSCSI+ -> NEC CDR-37
but the first host adapter in the chain has nothing to do with driving the
CD-ROM, its for a hard disk. The AdSCSI+ also has a hard disk running from
it as well as the CD-ROM

Drive : NEC CDR-37

Software :

ICDCDZ2.XFS as supplied on the ICD Pro utilities disk. This only seems to
work under MiNT <= 1.04. None of the other freely available CD-ROM drivers
(MetaDOS etc.) seem to work. I haven�t tried Extendos or CD-Tools.

For audio playing, I�m using Nima Montasser�s �Audio CD Master 3v0�. This
is the commercial release of the AUD_CD20.ACC audio CD player. Both work
fairly well for me, but I haven�t got all the features to work yet.

In order to CD Player configuration to work (the default NEC CDR-37 one
didn�t work! with AUD_CD20.ACC) I contacted NEC(UK). They very kindly
sent me a copy of their �SCSI 1 Spec� free of charge. This is a 90 page

photocopied document which lists all the SCSI 1 commands for a CD-ROM and
what they do. I m sure its pretty out of date now, especially as NEC must
be onto SCSI 2 by now.
I used the SCSI.PRG from the ICD Pro disk to send SCSI commands to the
CD-ROM to get the combination right.

```
-----------------------------------------------------------------
Atari Falcon030, 4MB RAM, 127MB Internal IDE drive, 270MB external
SCSI drive, Viper 105S Tape Streamer.

Drive : NEC 2xi
```

Non-working drivers: MetaDOS 2.3 (no BOS drivers for Falcon).
ICD Pro Utilities (didn t see the drive at all).
Atari CDROM driver, v0.6 (gave read errors).

```
Working drivers : ExtenDOS v1.11 (commercial, available in the UK from
Systems Solutions, price about 30 pounds).

Discs : Gemini Atari CD-ROM.
Cover disk from a PC CD-ROM magazine. The files read OK, but obviously
the PC-specific executables do not run. I got loads of TIF pictures etc
off of this disk.
The NEC 2xi is about the same price as an Apple CD300 (160 pounds + VAT).
But people seem to have had less hassle getting the Apple drive running.
I chose the NEC because is an internal drive, so slotted into my
mini-tower comfortably.

-----------------------------------------------------------------
TT030 4 Mb ST Ram, 4 Mb TT Ram, 210 Mb HD
Mint (1.04) + MultiTOS

Drive: NEC 210 (also known as NEC55j?)
(double speed SCSI internal drive)

Driver: CD-Tools 1.08 from Hard&Soft Computerzubehor GmbH
```

DOS discs tried: - The Best of Demo (Comptec Multimedia)
contains lots of GIF/BMP/MOD/TXT files
- Monster Media issue 2 1993 (by Monster Media?)
contains also lot s of GIF/BMP/MOD/TXT files
- TOP 101 shareware programs (came along with the drive)
hardly usable, only DOS stuff.
- Music Box 1994 (Powersource inc)
tons of MOD and VOC (about same as WAV) sound files.
Atari discs tried:
- DTP Grafiken (by Werbedesign Schutz)
contains tons of clipart files in IMG and (DOS) PCX
format, disc was made for Atari and DOS

Other drivers I ve tried are several earlier releases of Metados from
Atari, a modified Metados for the Falcon and some XFS drivers for
Mint/MultiTOS (ICD and Atari).

Most of them work OK but for some discs (for example the DTP Grafiken disc)
the older drivers cannot cope with the large amount of files in a
subdirectory (with DTP Grafiken there are folders with over 700 files!)
Clicking on the folder icon just doesn't open the folder
The driver from Hard&Soft seems to work for all of my current CD-ROM discs.

The XFS driver for Mint/MultiTOS is slow The Metados drivers seem to
buffer much more data, problem with Metados is that it's supposed NOT to
work with Mint/MultiTOS. However, I haven't got any problems yet.

TT030, MetaDos, Apple CD300
But it seems that the TT does not recognize a media change, and I get
some "not-responding" messages. After clicking <CANCEL> the loading is
performed perfectly.

```
>I chose the NEC because is an internal drive, so slotted into my
>mini-tower comfortably.
```

It is very easy to remove the Apple CD300 from it's casing. It just holds
an Sony CDROM player which can then be mounted in a tower without any
problems.
(I've done so) The casing can then be used to hold a old HardDisk which was
left
over from a upgrade to be able to transfer data between friends (Works
perfectly!)

```
PS. I bought my Apple CD300 here in the NL for about Fl.470,- which is ca.
$250
-----------------------------------------------------------------
TT, MagiX 2.00, MetaDOS 2.30
-----------------------------------------------------------------

Thanks to all the users that mailed me their experience.
```

2145. HP compress DAT drives

Newsgroup: comp.sys.atari.st
Date: 1994-11-03 08:45:02 UTC
From: markb@Name
Message-ID: <39a7ue$de4@hpwin055.uksr.hp.com>
Source record: 177887

What software available is there to use an HP DAT drive with an ST - using ICD Link II. I have got Gemar 2.20 and partly translated it, but I saw a message recently where someone said that they had to alter something to work with a DAT drive (I think it might have had something to do with compression)

The biggest potential problem is with your TT Fast RAM board. My
unaccelerated TT gets TT RAM from a MegTT board 1.4 times faster than
from an Atari TT RAM board (timed using GEMbench). This causes the
CaTT a few problems, although mods are apparently possible to get them
both working together happily.

I'm looking forward to having a CaTT (meow!)

Mike Goodman (mgoodman@goody.demon.co.uk) wrote:
: Anyone know just who is distributing Obsession.

Merlin PD without a doubt, you should see all the advertising they have
done for it! I remember adverts from like a year ago for this game....

: I received a demo today from JCA Europe.
: The label is marked:

: **Offical Demo - Please Copy & Distribute**

: One of the conditions in the readme says it may not be put on
: any sort of cover disk until March 1995.

It means don't put it on ST Format basically.
I can understand why, they'd make money from sales of the magazine.
However it would also help to make awareness of Obsession grow and secure
an even larger sales. Last I heard there were 2000 PRE-orders for it.

: ST Review says it's on next months!
: Whats the score?

>

This sounds like an idea I had about piggy backing the old 2 roms on the 2 new ones and pulling out the chipselect and switching with that...

What I wonder is, the two jumpers needed, if they're fitted, will the old tos work?
What exactly is the jumpers for?

/PO ~ happy when I get a working DMA chip for my STe....

In article <avg.783795350@news.cwi.nl>, Annius Groenink <avg@cwi.nl> wrote:
>>No, we should have a GEM based telnet app, but using MiNTnet.
>
>Answer to that is simple: GEM + MiNT = go make yourself a cup of coffee
>
A very very quick cup of coffee then. When I run MiNT without MultiTos Gem is
NOT slow.

If you want to run something slow: go ahead and make Mosaic! If you intend to
run it over a modem line you will see something slow!

>>As for the speed of MiNT, the slowdown is negligible and many functions are
>>in fact faster. It's only the multi-AES that's slow and that should be much
>>better.
>
>Should isn't good enough. And applications supporting xfs become very

Doesn't Gemview use the DSP on the Falcon? (There is a DSP option in one of the menus) The documentation that I have says that this is faster than a 16Mhz FPU - and all falcons have them (unlike FPU's).

|>
|> SpeedoGDOS for example or NVDI 3 have scalers for vector fonts.

>The whole point of porting UUCP stuff to MiNT is to use the minix
>filesystem though; linking (or sym-linking) files is much faster than
>copying them, and minix filesystems don't die when you drop a couple
>thousand small files into a directory...

Okay, I can see some point in that, but a good UUCP system doesn' _have_
to be able to cope with a major feed. If you really want to have that
sort of capability you really shouldn't be running an Atari in the first
place. I see UUCP on the Atari as a good way of dealing with a few (up
to 50 say) newsgroups, where there isn't going to be a huge demand on
system disk resources. Hell I ran UUCP with a small newsfeed on a dual
floppy system for over a year (not that I'd recommend it to anyone
though).

The problem I see, is that it is fine if you can run MiNT, GCC and the
MinixFS and configure things so that you have something that looks like
a Unix directory structure to the software that you compile; but this
does require a certain amount of expertise from the user. My argument is
that there should be really good flexible, interoperable software that
doesn't impose limits if you want to get it to do fancier things. UPoint
is a nice self contained system, but it will only do the basics and you
have to use it's own builtin Newreader etc. Hermes is much more
flexible, but even it has limits which are mainly to do with it having
been made to be backwardly compatible with Mercury. (The biggest
complaint I have with Hermes at the moment is the way that the mail and
news transport agents work by writing "magic" config files which are of
a very fixed nature. There also really ought to be a UUXQT type of program.)

The PC world and in particularly the Amiga world have quite a lot of
UUCP/Mail/News software that is interoperable (i.e. various programs
from different programmers work together without too much hassle),
without requiring that one completely change the character of your
operating environment and system setup, which is something that using
MiNT etc. *does* force you to do.

Just some thoughts! :-))

Cheers,
John

I couldn't get the patches to work, it failed every single hunk.

So I compiled the unpatched 1.10 without problems but now whenever it tries to
run anything including the desktop and any DAs it gives an illegal instruction.

>I wasn't able to format the HD so that partitions larger than 32Mb were
>recognized by both MSDOS and TOS.

Basically both MSDOS and TOS use the same filesystem which is limited to
32kclusters. Up to that point they are compatible; but to get round that limit
they use different methods.

MSDOS puts more sectors per cluster, so a 256Mb partition would have 16 normal
size sectors per cluster, making 8kb clusters.

Whereas TOS uses large logical sectors, so a 256Mb partition would have 2 4kb
sectors per cluster, again making 8kb clusters.

The two are incompatible, although the behaviour of TOS here depends on the
driver and it would be theoretically possible to write an MSDOS compatible
driver.

I'm not sure how compatible the HD formats are anyway, even though within each
partition they are the same (apart from this sector size quirk).

:Whoa, I'm a little confused, I've got Halekin 2, Printodisc.prg with Calamus
:1.09. At work its a 486 with a very nice Laserjet 4 which I'd love to print
:my Calamus stuff onto without bringing the Atari to work. Can you explain a
:little how I might do this? From what I'm reading it's quite possible?

:Thanx
:Peter Hopson

The idea is, if you have a good printer spooler that allows you to
capture print output of a program and hold it in memory and allow you to
save it to disk, then it is possable to use any printer. All you do is
select the driver for the printer you want to use, print it to the
spooler, save the spooler contents to disk, take this disk to a machine
with the desired printer, copy this file direct to the printer.

In my case, I use a Laserjet driver, save the spooler contents to disk,
upload this file to the university's UNIX system, then issue the command
lpr <filename>. The file is now printed on the laser.

Problems come about when the program you use uses it's own faster print
routines (like Calamus) and the spooler doesn't capture anything.

Although keep reading this thread.......

>I have no clue as to what software I need, and what "standard".
>The terms UUCP, SLIP, QWK etc. doesn't tell me a thing.
>What do I need?

There are three ways you can get internet access

1) a full tcp/ip connection (using SLIP)

On the Atari this either means using Mint-net, or using the horrible KA9Q stuff. Actually Mint-net is pretty horrible ATM but it should be possible to write gem based versions of ftp etc in future.

All the time you are connected you can do anything you can from a full internet site.

2) Via UUCP

With this you go on once a day to transfer packets containing mail and news, and possibly other files.

You want either Upoint or Hermes.

3) Terminal

Much as you've been doing with your university's system, dialing in. This way you can run text based versions of web browsers, newsreaders etc. All you need for software is a terminal program; but this way isn't as flexible and doesn't allow for offline reading.

QWK is a format for offline reading that originated on fidonet type BBSs, and which some terminal based internet providers will let you use, so giving offline reading. It is not really ideal for usenet as fido systems only have 16 characters for the area name (ie. newsgroup). The best QWK reader is probably MT-QWK, although a lot of people will disagree with me here.

Yes, it seems it does, but most often it's the same "random" world.
I remember having played on a different world only once in a huge lot of games. Anyway, you can set climate, mass land, and such things to rearrange (?) the world.

Now, something different: has anybody seen "very unhappy people" ?
They're in red, opposite to "normal" unhappy people who are in black.
I've heard of those VUP on the IBM version of Civ, and I was very surprised to see some of them in the population roster of some cities.
(I played a despotic conquest strategy at king level.)

In the same game, I also discovered the (in)famous "undefended city bug", that I also used to believe it was a PC only feature; and, to come back to the initial subject, I think it was not __exactly__ the same random world as usual ;-)

I'm pretty sure there are at least two versions of CIV for the Atari:
how does one can find what version number he got?

Thanks for any help on this.

I have an ST with mono monitor and have been given some games.
Unfortunately they all require a color monitor. Does anyone know of a
program that allows a high res mono monitor to emulate a med res color
monitor so that I could run these games??

Also I know there is a shareware program that allows mono
monitors to use the whole screen; i.e. it uses the black rim around the
outside of the screen. Has anyone any experience with this? DOES IT
REALLY WORK??

Cheers!

That's not true. Our UK distributor, Compo, was not aware of this until
they saw a magazine show up in their mailbox. They were quite pissed, as
they had just ordered several dozen units from the U.S. It is hard to
calculate what portion of that month's sale was generated due to the
included program, but it is impossible to calculate the total loss we
suffered due to that type of exposure. The program simply stopped selling,
overnight. Nobody wanted to buy what they could get on a magazine cover
disk.

How did they manage this, did they just put it on or as I heard somewhere
put the wrong version on, and not the intended cripplied demo version?

Did you get any compensation from this magazine?

I speak as someone who had some text published in STF without permission or
payment.

Several people have mentioned that you just need to swap the chips
and move two jumpers on an STe. I'd like to add a warning that not
all STe's are like this. Some older models, like mine, have
soldered-in resistors instead of jumpers. You have to cut one end
of each resistor, and then move and solder that end to a new location.
Or, you can remove the resistors and solder in jumpers. Either way,
it's not plug and play; best to check your motherboard before you buy.

The main points are support of XHDI 1.25 and bus arbitration. Bus arbitration is for TT SCSI and Falcon SCSI only, not for ACSI. In bus arbitration mode drives like the Quantum Empire 1080S or the MOD Fujitsu M2512A can be connected to TT or Falcon. This wasn't possible before.

>UK. I'm hoping for Sense Errors to be reported inthe same way that ICD

This is not planned but I'll keep this in mind.

>didn't report that it hadn't found my drive due to the default being set
>up for a different arrangement of ID numbers.

HDDRIVER only reports the drives it has found, i. e. you know that a drive wasn't found if HDDRIVER doesn't tell you its name during booting. I think this clue is enough to tell that you didn't configure the correct SCSI IDs.

Netscape is out in Beta now - its one of the "newer" versions of what mosaic might become. Blazingly fast compared to mosaic in some of its operations - and new operations have been added. It might be better to shoot for that instead of just getting us to where technology has been (although that's still better than nothing.) Ideally you want to aim for where technology will be when you introduce your product, now where it was when you started working.

sheppard_r@kosmos.wcc.govt.nz (*Roger Sheppard.*) happened to write:

RS>The other thing a lot of the New W.P. use Speedo GDOS and Fonts, I
RS>think a 4 meg machine is far to small, but that would depend on how
RS>many fonts are loaded, windows used etc....

That's simply not true.

I work with a 4meg MegaSTE with NVDI 3.01 and at the moment I've *lots* of
fonts installed. No problems whatsoever with my WP or any other software which
uses GDOS and the scalable fonts.

With my current setup I have about 2,6 megs free when I'm on the desktop.
Thats plenty for what I'm doing. When I need all the memory I can get, I use
SuperBoot to quickly alter my config.

2183. Re: What is a BGM partition?

Newsgroup: comp.sys.atari.st
Date: 1994-11-03 19:09:00 UTC
From: Hendrik_Mylius@pb2.maus.de
Message-ID: <199411032109.a11029@pb2.maus.de>
Source record: 177827

On Tuesday November 1st at about twenty-five past four
boyd@math.fsu.edu (*Mickey Boyd*) happened to write:

Hey there, working late Mickey ;-?

MBB>understanding is that devices hooked to the TT SCSI port use the same
MBB>partition structure as those hooked to the DMA port, but I cannot

There is no difference in the logical partition structure on any port. Not on DMA, nor on SCSI, neither on IDE. And as always there is an exception to this: When you use e. g. an SyQuest- *IDE* 270meg removable harddisk with media formatted on the PC, the High-/Low-Byte is swapped! Thats the Intel-way of doing it. Atari wasn't intelligent enough to fix this directly in their IDE-adaptors. The driver has to do all the work now.

The bootsectors might be slightly different on those ports, though! I think I've read s. th. like this somewhere in the ICD docs.

Important note:

Not all versions of TOS can handele those larger sectors and high numbers of sectors. All versions =< 1.04 were limited to 32.767 sectors.

TOS =< 3.06 can handle up to 65.536 sectors with a maximum of 8.192 bytes/sec. That gives you a max. of 512 megs/partition.

Only the Falcon-TOS (current and future versions of Mag!C as well) can handle sector sizes of up to 16 kb. That would allow partitions of 1,073,741,814 (1GB) bytes :-)

But with such large sectors you waist a lot of HD-space as every tiny little file costs you 16kb!

But there is on glitch doing this with all versions of TOS prior to 4.0x. In *very rare cases* the _file_ using the sectors of cluster 32.767 could be damaged. *The rest of the partition stays intact*.

To prevent this from happening the sector at the 32.767 limit should be marked 'bad`.

Claus Brod, Juergen Lock and Julian Reschke discovered this bug.

The limitations I mentioned above are not actually caused by TOS, but by the GEMDOS. But as I'm not aware of the GEMDOS versions in the different OS-versions I just referrdd to it as TOS.

Try EssCode 6.2 (esscd62.zip)- it's the most advanced and fastest.
It's a full GEM-program, and also handles MIME, SHIP, and BTOA-
coding, all with user-definable segmentation (if allowed by the
protocol).

There are also TTP-based coders (UUE.TTP UUD.TTP), and at least
one other GEM-based (Murks 1.05).

>BDOS calls of CP/M are duplicated _exactly_ in MS-DOS. Considering
>the implications, its a wonder that DR didnt sue Microsoft in
>the first place! (and not vice-versa!)

The recently deceased Gary Kildall was the author of CP/M and founder
of Digital Research. There were many CP/M clones out but DR never
sued. Most OEMs wanted real CP/M. Microsoft did not write DOS.
Another company developed a CP/M clone that ran on the 8088/8086.
Microsoft bought out that company when they "won" DOS development from
IBM for the PC. DR didn't have CP/M-86 at the time. IBM did sell
CP/M-86 but priced it about 3 times what they sold DOS for. Needless
to say, this spelled the end of CP/M and the birth of the MS monopoly.
Considering the IBM-MS conflict going on now, I'm sure IBM regrets this.

2188. MiNT problems (1.10h8/1.11h2)

Newsgroup: comp.sys.atari.st
Date: 1994-11-03 20:04:50 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <783893090snz@bigbox.demon.co.uk>
Source record: 177074

Hi all,

I am having trouble with MiNT. My system is a Mega STE (4Mb), MiNTos 1.4, tcsh,
and MiNTnet 0.53.
MiNT 1.10h seems to have problems jamming up in io over sockets. ping doesn't
seem to work over the serial port (could just be something else), it seems to
drop the majority of its packets. ntalk jams up, though this seems to be
solveable by continually typing on both ends of the connection. Telnet jams
up as soon as a login prompt appears.
MiNT 1.11h2 jams up in all io I have tested after a random amount of time.
Under tcsh you can type ^C to wake it up again, but not under other programs.

Also, I can't seem to su to root, even though I am in group 0 in both
/etc/passwd and /etc/group.

Any help appreciated.

Yes, it does work. It is a very simple hardware-modification you do to
your ST's motherboard. It requires some software to work though.

All of you with overscan-modification should have a look at a program
called LaceScan, it is a very nice overscan-soft.

I am just guessing with regard to Civilization, but it may well use the time to seed the random number generator. If that is the case, then (unless you set the computer to the correct current time (on which ever of the various clocks the ST keeps that is used by Civ.) your random world my well depend on how many pairs of seconds go by from when you start the computer to when you start the game. Thus, if you turn on the computer and then start the game, if my guess is right you will see very few different worlds, but if you turn on the computer, walk around the block and then start the game you will see various starting positions.

2195. Pet peeve: "The Atari"

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 01:07:55 UTC
From: mrathwel@uoguelph.ca
Message-ID: <39c1hb$2gj@nermal.cs.uoguelph.ca>
Source record: 177840

Is it just me, or does anyone else have the same pet peeve as I have? I personally get irked when people say "they have an 'Atari' for sale" or are looking for an "Atari". Like ... be more specific people! Atari does make more than one machine, and ignorant people often don't realize this. Do they mean:

- The Atari 2600 VCS?
- The Atari 5200 Super-System?
- The Atari 7800 Pro-System
- The Atari Lynx?
- The Atari Jaguar?
- The Atari 400 or 800?
- The Atari 1200XL/800XL/600XL?
- The Atari 130XE or 65XE?
- The Atari Xe Game System?
- The Atari Portfolio?
- The Atari 520 or 1040ST?
- The Atari Mega ST?
- The Atari TT?
- The Atari Falcon030?

Sorry folks, but "an Atari" won't cut it. Please be more descriptive about what your describing.

2197. US/European Mega keyboards: diffs?

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 02:34:44 UTC
From: swhatley@blkbox.com
Message-ID: <39c6k4$lg8@news.blkbox.com>
Source record: 177842

Uh oh, somehow I accidentally posted this on comp.binaries.atari.st.
Didn't mean to. Sorry. Well here goes.

One thing I have not understood (among many) is why the differences between
the US and European Mega ST keyboards. According to the User's Manual
the US keyboards (which I have) has five keys above the cursor keys and the
European one has six. I know this is a trivial question but I am simply
curious. What is this sixth key?

Thanks,
STeven Whatley

2199. Cubase V3.11 ST for Sale Cheap!

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 02:48:54 UTC
From: acurtis@theshack.demon.co.uk
Message-ID: <AADF5196966883A58@theshack.demon.co.uk>
Source record: 177844

Hi There!

Because I am re-routing my music work onto the Mac (whilst retaining both my ST's) it would appear that my copy of Cubase is up for grabs.

The price is £125 including shipping in the UK.

Email me if you are interested. All manuals, dongle etc. Included.

Overseas buyer may need to pay excess shipping.

Cheeers!

2201. Atari-ST MIDI Software for sale

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 03:08:52 UTC
From: michaelk@pacifier.com
Message-ID: <39c8k4$e5u@pacifier.com>
Source record: 177743
Cross-posted to: rec.music.makers.marketplace,rec.music.makers.synth,comp.music,comp.sys.atari.st

Atari-ST MIDI software for sale

Dr. T's COPIST: V1.5 -- Notation Software $10

Dr T's FX PAC-1 -- effects processor editor/librarian: works with SPX90,SPX90II,LXP-1, DSP-128 & Multiverb $20

MIDI DRAW by Intelligent Music, draw with mouse & artwork is "played" back by your Midi synths (does not work with STE) ...$20

OMNI-BANKER ST -- Universal Midi Librarian, patch/bank librarian covering LOTS of synths $20

SynthView Editor/Librarian for the Korg DW/EX8000 .....$15

SynthDroid Editor/Librarian for the Korg DW/EX8000 .....$15

GENWAVE, sample editor supporting: Emax,EIII,SP-1200,SCI Vs, 2000.2002,3000,Yamaha TX16W, Roland S50/550/330, Korg DSS/DSM, Dynacord ADS/ADD-1/2, Casio FZ-1,10M, Ensoniq EPS, Peavey SP (via Midi sample Dump), OBERHEIM dpx-1 & Prommer, Akai S900 (12 & 16 bit),S950/1000, Frontal Lobe/PCM Channel and it supports SDS!!

Quoting directly from the December, 1994 issue of Keyboard Magazine:

" ....You actually get two programs: Genwave/12 talks to 12-bit samplers, including Akai S900/950, E-mu Emax, Korg DSS/DSM [etc etc]......Genwave/16 talks to 16-bit samplers including...Casio FZ series, Roland S-770/750 [etc etc].......On several samplers, real-time loop editing is supported, so you can hear you edits directly out the sampler as you make them..........The looping screen is thoughtfully designed with two waveform windows, a close-up view and a full overview. A pointer marks the area on the overview that's currently under the microscope. The windows are linked, so as you scroll the close-up view, the arrow on the full view moves.....Both GenWave/12 and 16 feature EQ, enveloping, and FFT spectrum analysis; Genwave/16 also gives you sample-rate conversion, time compression/expansion, time-variant EQ drawing, a noise/sine generator,and pitch detection and drawing. Importation of Macintosh and Atari ST Sound Designer files is supported."

I was even able to get Genwave to work on my Falcon in ST MODE. $150

all programs have the manuals ..... Buyer pays shipping, will ship C.O.D.

Apology, the 2 persom comms program that I was talking about is JEKYLL,
not Chatmidi. It is thru the serial port to the modem as normal on both
programs.
Chatmidi also has split screen chat and it allows you to play someone's
midi setup, remotely from yours, over the phone line. It does not do file
transfer.
The name mess up was not my fault, it was caused by a bottle of red wine :-)
Regards, Julian.

>problem?

I had one of my sm124's die twice from having 2 non-poarized capacitors die
at different times. The symptom was either a vertical or horizontal _single_
white line - depending on which cap went. I replaced the old caps with ones
that had the same value (2.2 microfarads) but a higher voltage rating and all
has been well since then. Be sure to replace n-p caps with _only_ n-p caps,
I found the spares I needed at Radio Shuck. ;)

I assume that you have an mc 68030 inside. If this is the case, rename
MINT.PRG in your AUTO folder to MINTNP.PRG to turn off memory protection.

: or send it to me via e-mail please. Also which files would I need?

Hi Daniel,
SITE: ftp.tu-clausthal.de [139.174.2.10]
SUBDIR: /pub/atari/graphics/viewer
GEM-View (sub-dir bw/co lots of types (very best!) 3.08)

Get the whole sub-dir, but at least gvw3inst.app and gvw_v308.pax.
Best regards, Peter (fpf@math.uni-wuppertal.de).

This is most probably because of whitespace differences (especially
CRLF vs. LF). Apply them with `patch -l' (loose).

It's a misprint. The current version is 5.0c. Version 5.0c supports the Type 1 and TrueTyps standards, and has lots of workarounds for non-standard fonts. You should be able to use any Type 1 or TrueType font.

SpeedoGDOS 5 caches the 'load font' data, so applications (like Works) load the font list almost instantly when they launch.

AFAIK, the only difference between the keyboards (apart from the
different labels) is an additional key between the left shift and the
'z' key (or 'y' on German keyboards). At least on German keyboards it
is labeled '<'/'>'.

I agree with you there. In most people's eyes, an Atari means a ST.
many people do not even know about the TT, let alone the Falcon.

I was talking to my cousin yesterday, and he asked me what computer I
would buy if i sold my Atari (he meant ST). He said that looking at my
Atari, he thinks the PCs are much better....just compare the
graphics...

Uh oh, I thought, here we go again....another PC minded person. I had
to explain to him, that the ST I have is of really old
technology....mid 80s...68000 processor Why was he comparing his
Pentiums at work with the likes of my ST. He should compare it to say,
a TT, or a Falcon, or maybe even a medusa.

The only reason he's buy a PC was because everyone had them....equating
to more software (ie free commercial stuff). Whatever happens, unless I
can get a Pentium for say 50 Pounds, I would not buy one...and even
then, I would use it as a Linux machine. I just can't see why my
cousing likes Windows and DOS so much. He hasn't even tried Unix, cos
once he's tried that....he will never look back at DOS (IMHO).

It sounds like your newdesk.inf file is corrupt. This is easy to do
with a text editor which deletes trailing spaces on lines - one line
in newdesk.inf *must* have trailing spaces.

Delete your newdesk.inf, restart your desktop, and do a save desktop.

Another possibility is that your newdesk.inf is too big for your
internal shell buffer... There is a utility to increase this called
SHBUF.

>way (you tend to write a loop waiting for each event to happen).
>
>

My DU_LIB GUI library for Lattice C (& HiSoft Basic2) provides support for
callback functions:

Single & Double click events can have seperate callbacks.
Redraw functions can be associated with objects (a redraw function is
a callback which is called automaticly whenever an object is redrawn).

It's not really suitable for use in porting Motif stuff (I don't think so
anyway) - but it does illustrate that you can quite easily move the emphasis
in a GEM program away from the event loop and into an object->function model
quite easily. The GUI library owns the real GEM event loop, and parses AES
events for you, calling callbacks where appropriate.

The arrangement I use is to have a series of

Set_object_callback(dialog, object, &routine);

statements to set up the links. Dialog also includes menu.

When the routine is called, several globals will be valid:

this_object: The object the routine is being called for.
this_dialog: The dialog the routine is being called for.
cr_wind_handle: The window containing the dialog in case there are
multiple copies of a dialog open at once (eg. the dialog form

is being used as a toolbar at the top of an editor window).
plus several others giving details of the objects screen location.

You could probably use a similar approach to create an X porting library?
The amount of additional work would still be really severe though.....

As an additional note, someone mentioned a while ago that they had
developed an X interface library for GEM AES calls, for compiling GEM
applications to run under Unix+Xwindows - has anyone come accross it yet?

Craig.

2224. Re: ps files from Calligrapher

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 12:16:00 UTC
From: Hendrik_Mylius@pb2.maus.de
Message-ID: <199411041416.a11046@pb2.maus.de>
Source record: 177780

On Wednesday November 2nd at about five to two
sheppard_r@kosmos.wcc.govt.nz (*Roger Sheppard.*) happened to write:

RS>I have been told that if you have a TT or better with 100 megs of Ram
RS>and 1 gig Hard Drive you can play with Gostscript, but you end up bald
RS>trying to get it to work, plus I think it does not supports Home type
RS>9/24 pin printers...

Oh Roger, come on.

Do you believe in everything some sh*t tells you? Well go figure ...

The whole GEM-GS 2.61 with all the fonts and a nice shell consumes about 6
megs on my HDD. On my MegaSTE it's not blisteringly fast, but it works ok.

And there are so many printer drivers included.

RS>To me the Atari computers all models, are comming to be a big joke,
RS>even to run SLIP you need some 10 programs when a PC clone can do it
RS>with just one Terminal Program that have every thing built in,

Well, if the machine is that stupid, Roger, why are you still using it? Go buy
a PC and spare us your bloody remarks and comments in the atari groups. If
you cannot handle a simple installation on your Atari, *you* certainly won't
be able to configure a PC with networking-tools, drivers for HDD and grafix-
cards and all this stuff.

RS>They can't even use the CD disks that PC clones use...

Have you tried to connect a CD-ROM which came with a Sound-Blaster to another
adaptor or Soundboard? Well have fun. Those *cheap* CD-ROM's usually only work
with the shipped controller. They have not the standard IDE-interface commonly
used for HDD's!

Only the latest Mitsumi CD-ROM's have such a standard IDE-interface.

RS>I no longer tell people that ask, what computer that I use as they
RS>just snigger and think you must be stupid, or no nothing about
RS>computers to be using such a stupid machine...

Everybody judge for yourselves ...

Roger, perhaps you shouldn't stay up so late in the night. Your mails are
often childish, but this one was plain *stupid*!

>one other GEM-based (Murks 1.05).

The UUE.TTP/UUD.TTP programs are very slow; avoid them unless you have a fast machine. Murks, I think, is designed to take a segmented UUEncoded archive and build a non-segmented archive out of it. I'm not sure if it does the actual decoding. It might, though. I'm just not sure.

ESS-Code is available at micros.hensa.ac.uk if anyone would like to take a look. The filename is esscd62.lzh (or at least it should be called that).

Nope, we had never even talked to them. Nothing about a cripled version or
anything like that. Our program appeared, and someone had edited the
"About..." dialog box to delete our company name and replaced it with
HiSoft (who had no rights to the program either).

> Did you get any compensation from this magazine?

Not a cent. Instead all our sales of the program died.

Nope, we were the exclusive agent for that English version. It was very easy to check, the About box had our name on it (which someone deleted with a resource editor). However, they didn't bother deleting our name off the installation program and several other files ("Copyright Gribnif Software...etc.").

> Also it was not the very latest version....

It was the current version at that time.

2235. Jag Joypad

Newsgroup: comp.sys.atari.st
Date: 1994-11-04 14:15:57 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <39dfmt$556@whitbeck.ncl.ac.uk>
Source record: 177799

Well - finally bought a Jag joypad to use with my f030 (it's easy now that most shops in Newcastle carry the Jaguar (well, HMV & Fona to name two of the bigger ones)).

I was feeling depressed at spending 24.95 on a joypad, but then I saw the price of a 3d0 joypad (39.95) and that made me feel better :)

Now I can play Llamazap & Steel Talons........

Craig.

No, I am still working on v1.0 and it looks like another month or
two before it is ready for release (depending on how much time I
have left over for programming).

>where it was when you started working.

The current plans for the Web-browser on the Atari series will probably
not be based on currently existing programs at all. This is because
buying a licence from NCSA or Mosaic Communications would not be
realistic for the Atari market, and of course because we think we
can do even better.

Yes, Netscape is better than Mosaic. But it is not ideal either.
It is very fast and convenient, but it still has a few quirks which
can be circumvented (such as that a ZOO file by FTP is always
transferred in ASCII mode, even if both ends are type UNIX).

A friend has asked me to post this on the net and I'm afraid I don't know if this is the correct group for it. Could someone please enlighten me as to what this beast is, what it may be worth and, if this is the wrong group for it, where else I might post it?

Thanks!

Rick

FOR SALE: to a good home

Atari SC1224 (with about .07 miles on the odometer)
single floppy drive
mouse, joystick, dustcovers, disks, manuals etc.

Software:
Arena Leader Board (golf)
Super Cycle Basketball
Paint Pro Hacker II
ST Star Raider Sky Fox
Star Glider Deep Space
Space Quest Super Huey (helicopter simulator)
Print Master VIP Spreadsheet
Chess Master 2000 Certificate Maker
Dollars & Cents Timeworks Wordwriter
and more

Panasonic KX P1080i letter quality printer
with ribbons, paper, dustcover, manuals etc

All for $300 or best reasonable offer.

Owner lost interest shortly after purchase, and it's such a shame to have it just sitting around gathering dust.

Please call Laurie Cherry 508-436-4357 days

>Right, it needs MiNT >= 1.10, but the public version of 1.11 must be out
>before you are able to get a gem'ed Mosaic up and running - even in beta.

Is this a challenge? I dare predict 1.11 will never be released at
all. And if it is, who will use it? We had over 50 reactions to our
Support Mosaic request, and 75% of these said: don't bother, I don't
even *want* to run MiNT.

MiNTnet has all of that, yes, but it also has a large amount of
unpleasantness to it: MiNT.

>So - nothing is stopping you from including mint and mintnet (+ an
>easy-to-use-even-for-lusers installation program) as long as you follow the
>GPL.

Which would mean we cannot ask any money for the application?

>MiNT+MiNTNet is/will be the standard OS extension - like it or not.

Nobody will follow the standard - like it or not. Besides, there
will really be many standards: Magic in Europe, Geneva in the US,
and MiNT in a few small hackers' societies.

>So if
>you do decide to include your own drivers, please make it possible to use
>mintnet as well. Who knows, someone might even make a SCSI-ethernet driver
>for it as well someday...

We will always try and keep that option open. But the first version
may not *yet* have support for mtasking slowperating system extensions.

There are several midi network programs in umich, (and probably many other archive sites). I have used a couple (sorry, can't remember their names at this second) and the allow my to access one hard drive from two STs (one STE on one STFM). Midi leads are cheap, so you should try it out.

Hope this helps.

Andy.

>for it as well someday...

At the risk of offending MiNT users, I have to say that many ST users are
less technical-minded than those who use and like MiNT. I don't like unix, and
have no use for it. I understand that anyone that likes a particular system
wants it to be the 'standard', and thinks everyone else should learn it no
matter how difficult. However, many of us are more than happy with basic
MultiTos, Geneva, or even the standard built-in TOS and do not wish to spend
endless hours learning MiNT when we have no use for it. Many of us simply have
ST's for our home-computers and wish to keep them easy to use. So I think a
basic, solid, all-in one package would bennefit the greatest number of users.

MBB>Also, software updates from Genie/Compuserve are quite nice.

Will there be *any* further development beyond 6.5.5? I have a very strong
feeling that ICD are not going to be active on the atari sector anymore.

Maybe I'm wrong, maybe not ...

On Wednesday November 2nd at about a quarter past twelve
graham@insignia.co.uk (*Graham Beint*) happened to write:

GB>GS 3.01 are already set up for use with epsons both mono and colour.

A friend of mine is in the process of compiling GS 3.1.2. All the patches are already installed in the source, but there are some name changes still to be made.

Is Tim still working on it?

GB>Oh? ExtenDOS and Apple CD300 as sold by System Solutions would appear
GB>to manage quite well.

So does my Toshiba XM-3401 and CD-Tools. Works great.

GB>If German airports are quite happy to use an ST for managing
GB>international air traffic movements ...

There was an article about this matter in the June *1990* issue of the German ST-Computer.

On the *Frankfurt Airport* they used a 520ST with half a meg and an SF 314 diskdrive for the controlling of messages in the *AFTN* (Aeronautical Fixed Telecommunication Network) and in the *SITA* (Societe International de Telecommunication Aeronautique).

The bosses' secretary used a similar machine, plus harddisk and SLM 804 with Wordplus and Calamus, to take care of the daily correspondence.

I dunno if they're still using it. Do you have any information about this, Graham?

GB>Brain in neutral, mouth in gear again!

As we know him, don't we :-/

Hello all! I have a brief question (I hope). A friend of mine is using an Atari 1040 ST to run a midi sequencer software package. He recently saved his material to floppy but received a disk error message when he attempted to retrieve his data. I am not familiar with the Atari machines so I was not very helpful. My question is: What disk fix utilty can he use that may recover the corrupted file(s), if one is available. Thank you.

2257. Monitors for sale

For Sale:

One color monitor (JVC type) asking $120.00
One monochrome monitor asking $80.00

Both of them are in fine shape, will sell both for $150.00 as a pair.

Leave mail here or at Howe@ukpr.uky.edu Thanks!

An Atarian, Miles Howe

I am working on a X Windows Server for Atari Linux-68k. With the mono
resolutions, it is working already fine. Currently I am writing the parts
for interleaved planes (not easy...). Later i will try to make a stand alone
port for use on ST/F030/TT with Mint or Tos. Of course its free software.

>purposes are on a similar scale?!

Ok, you sit down and play Starball for more than thirty minutes and you are completely bored, if you do all the sub games what is left.

At least with Obsession you have 4 tables to choose from, improving the playability beyond Starball by 400%. Also, with Obsession when you pay for your copy you will get support from your reseller or from the programmers.

Starball was a 5 GBP registration, which as a library we sent, no thanks or anything so remember support and more tables add to your enjoyment and to the play
ability of the game.

2263. Re: Civilization

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 00:41:11 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <39ekb7$a00@josie.abo.fi>
Source record: 177694

As someone thought, there are at least three different CIV versions for Atari ST. I found it out, as my bought CIV didn't like my Falcon-030 at all... Some people said that it _should_ work, but it just didn't. Then one very kind person sent me a newer civ.prg file than that I owned. I replaced my original file with the new one - and: miracle! Civilization works great on my Falcon.

If this helps anyone, the size of a _working_ CIV.PRG is 445.984 bytes.

I think, this file should be uploaded to some FTP site, since one can't play the game without the rest (MANY!) game files. PC owners can update their games via modem - so why shouldn't we..?

BTW, those ramdom worlds really are "random". Or I've had only those. Maybe it depends on the version of the program or/and the in-built clock?

Tommi

This is only true of course, as long as you use the TOS file system. With
the minix file system (minix.xfs) disc space will always be allocated in 1k
chunks, regardless of logical sector size. As minix.xfs also does away with
the 8+3 filename limitation and is faster than the TOS file system, which has
its roots in CP/M & MS-DOS, it would seem to be the logical choice of the
day.

> technology....mid 80s...68000 processor Why was he comparing his
> Pentiums at work with the likes of my ST. He should compare it to
> say, a TT, or a Falcon, or maybe even a medusa.

PC minded people can be very blinkered. Often I am asked what sort of computer I own. The expected answer is 386 or 486. When I explain I have a TT, their faces just go blank. Then I move onto the technical spec. They generally are impressed with the TT-Hi screen, and mildly impressed by the 8MB RAM and 200MB hard disk. When it comes to the processor - we both get stumped. The've never heard of the 680X0 range and don't understand enough about the Intel range to allow me to make a comparison. Generally in the end I say its a bit like a decent Mac from about 2 years ago.

Luckily I invariable know more about PCs than the PC owner I am talking to. The line they generally fall back onto is the amount of software you can pirate for the PC, compared to anything else. This argument doesn't go far with me ;-)

> The only reason he's buy a PC was because everyone had them....equating
> to more software (ie free commercial stuff). Whatever happens, unless

Piracy of software is what keeps the punters buying PCs. many PC owners I know just won't contemplate buying software. Why bother when you can always pirate it. Even with CD-ROM, CD-R units are dropping so much in price that CD-ROM piracy will be rife by this time next year.

> then, I would use it as a Linux machine. I just can't see why my
> cousing likes Windows and DOS so much. He hasn't even tried Unix,
> cos once he's tried that....he will never look back at DOS (IMHO).

Although many PC owners will never like Unix even if it is more powerful. They can hardly handly DOS and have no love of CLI. Often at work I am asked if there is a C compiler for the PC they can 'borrow' (pirate). When I explain that there is a perfectly good C compier on each of the 4 Minis, they are just not interested. Somehow the view that unless you can do it on your own PC, then it isn't worth it - is prevelent.

I can great satisfactiong from telling people that I have Windows on my PC and don't use it. Not becasue I don't know how - but that it intrinsincly hammers the machine. A lot of the time my Pc is used as a dub terminal to a Unix machine anyway.

:-)

Roland.

2266. New release of CBZONE 1.0

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 01:29:15 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CyrtGr.36B@cix.compulink.co.uk>
Source record: 177730

I have just released a new version of my CBZONE port. CBZONE is an X-Windows Battlezone(TM) game which I have converted to the Atari. It should work on all Ataris - but is happiest on a TT or Falcon with FPU as it makes big use of floating point maths. It is much improved over earlier versions and now runs in many *colour* modes.

CBZONE is believed to be Freeware and as such can be freely copied.

However I am imposing a copying restriction on the Atari version in an effort to support my 'local' FTP site and encourage people to use it. Therefore this version of CBZONE is only to be available from HENSA.

micros.hensa.ac.uk

micros/atari/tos/p/p002/cbzone10.zip

Outside of the Internet it can be freely copied. There is no restriction on distribution via PD libraries nor BBS. The only exception is the CiX BBS (my 'home' BBS) as I want to encourage the users of CiX to use the Internet gateway provided - and use HENSA more.

CBZONE10.ZIP includes executables for 68000 and 68030/68882, and all source code for both these, other versions and the X-Windows stuff. It is about 150K in size.

This archive superceeds CBZONE02.ZIP and CBZSRC02.ZIP which are currently available on the net.

Roland.

I've just been given a cdar504 Atari CD ROM Driver. I got
the metados2.zip file from a.a.u.e and installed it. Actually I
tossed the whole thing (after extraction) into the auto folder, per
the instuctions. Only problem is I get BOS device is not responding
bos device is not installed, and the same for the 2 DOS files.
Anybody have any ideas how I can access this thing? It should
work with metados2! I mean it's old enough. I'm running the ICD 655
booter software on a 4 meg STe with TOS 2.06 and an ICD AdspeedSTe.
OH, by the way does anyone know what The different setting are for the
4 dip switch in the back of this thing? I know it should be for the
scsi device no, but what setttings mean what?

> to the Atari ST ? (i've heard it's possible).

There are a number of products that allow one to do this. I seem to remember one called Z-keys, which was not so good as it required a software driver to work (so games and such would require the Atari keyboard). A better unit was called the DEKA (now DEKA II). It was hardware-only, and worked quite well from what I hear, allowing you to totally ignore the Atari keyboard if desired. I still see them for sale by a couple of companies here in the states, for about $90 new.

GEnie users go get a copy of the latest GEnie Lamp,
It looks like we could be loosing the interface to those PC clone
maniacs..

They are talking about support for Windows, no
more text based system, this could be due to pressure
from American Online...

This could also affect the other firms like Compuserve, Delphi etc...

What about the Amiga users, will they also be affected...??

From: jprice@ivory.trentu.ca
Message-ID: <1994Nov5.073855.14945@blaze.trentu.ca>
Source record: 177739

THANK YOU! I posted here a while back looking for software that supported Kermit and that would allow me to get on my net server with my ST. Someone e-mailed me and suggested Uniterm. Well, here I am with my ST and I don't have your original message so I can't thank you personally. I just hope that you see this and receive my gratitude. It works like a charm!
It's particularly appreciated now as my PC monitor went down a few weeks ago and I can't afford to get it repaired or replaced at the moment. So, double thanks. You're a life saver.

Dextrous will be a full operating system erplacement. It will be compatable
with NVDI and Speedo, but as the author says, NVDI is very slow compared to
his code, so he want's to build font support directly into the program itself.

: I couldn't get the patches to work, it failed every single hunk.

Did you give the -l option to patch? As the source code stands, it has
Atari style CRLF in the original 1.10 source and UNIX-type CR in the
patches. This causes all the hunks to fail if you don't use -l.

It patched up perfectly on my machine. Which doesn't do me much good
because I still can't get it to compile, no matter what.

It's NOT!! their fault at all. Any author of shareware products which is
receiving money for his program is responsible for this, and even more
if he take the money. You can sue an author who doesn't follow the rules,
even though it's shareware. And you will win, if you got enough money for
the lawsue.

>program that allows a high res mono monitor to emulate a med res color
>monitor so that I could run these games??

There are several on a.a.u.e. I use one called 'bigcolor' (not sure if
it is the aaue one), but AFAIK this (and others) only works with GEM
programs.

>Also I know there is a shareware program that allows mono
>monitors to use the whole screen; i.e. it uses the black rim around the
>outside of the screen. Has anyone any experience with this? DOES IT
>REALLY WORK??

There is a *hardware* mod that allows pre-STe machines to use a bigger
than normal screen. The software allows programs to recognise and use
the bigger screen area.

markb@Name:.UUCP (*Mark Bridgett*) happened to write:

MB>using ICD Link II. I have got Gemar 2.20 and partly translated it,
MB>but I saw a message recently where someone said that they had to alter

GEMar is definetely the way to go. Perhaps you have to alter some of the
parameters to make it work with your DAT (How convenient if one is a HP
employee :-)

Perhaps you have to set some jumpers in the DAT as well.

BTW, there is a newer GEMar version 2.21something available.

Have you tried to ask Steffen about your problem? *Steffen_Engel@pe2.maus.de*
is the address where you can reach him.

2296. NEED UPLOADERS (FREE REGISTERED VERSION)

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 16:14:10 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <EKFKBBUQUp@elfhaven.ersys.edmonton.ab.ca>
Source record: 177476

Hi,

I need a user (or several users) who have access to GEnie, Delphi, or CompuServe and are willing to upload MasterBrowse/ESS-Code to these services in exchange for registered versions to contact me.

The person who handles this no longer seems to have an account at all, so it is time to look for new blood... If you are willing, please contact me at mforget@worldgate.edmonton.ab.ca as soon as possible. Please do NOT respond to this address, as I read mail from it only once a day.

Thanks...

2297. XUFSL - A Few Notes

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 16:18:44 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <EKFKBBUSUp@elfhaven.ersys.edmonton.ab.ca>
Source record: 177475

Hi!

Has anyone seen xUFSL, the extended universal font selector? It is
available at ftp.uni-paderborn.de in pub/atari/tools/gdos/ as
xufsl103.zip.

It is -VERY- nice; from what I saw, here are the highlights:

1) It seems to work with programs that support only UFSL. At least I know
it works with MasterBrowse and ST-Guide.

2) It provides a -LOT- more information to the user than the old UFSL did,
and looks much better. Programs meant for UFSL have most of the options
greyed out, but the sample calling program activates them all so I
imagine you can get some very nice features with a little effort.

Also, the same FTP-Server has the new version (07) of SozobonX and some
other very nice programs. Take a look at INDEX.NEU and INDEX.LAST_WEEK
for a list...

2299. Q: Cumana OSK v2.3 and Atari STE ('E')

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 17:23:27 UTC
From: paulseniura@delphi.com
Message-ID: <hc01LdX.paulseniura@delphi.com>
Source record: 177657

Hi,

I presently have an expanded Atari 520ST (akin to a Mega-ST4) which
is working (mostly) fine with Cumana's OS-9/68000 v2.3. It's just
for a hobby right now so I can't even consider to afford to upgrade.

I am considering buying a Mega4-STE from another Internetter, but I
really must know if my copy of Cumana OSK will work on it first.
It's the hardware changes and 'new' gizmos on an 'STE' model (i.e.
the 'E' stuff) that I think will prevent OS-9 from working on it.
But I could use & write drivers for the dual 8-bit DMA sound ports
etc. if stock Cumana OS-9 v2.3 will work on it (not to mention
adding hi-rez graphics via the VME buss B-)).

Second, I'm still needing info whether GESPAC's 'G-Windows' is
available for *any* of the ST(E) models capable of running OS-9.
Reccoware's prices for a complete 'MGR' package (Atari-ST monochrome
mode only), run-time and development libs, are in the neighborhood
of US $800 give-or-take. That's totally way out of line for us
hobbyists hackers, and no one's made me any other offers (such as
third-party 'discounts').

I really need some facts. If you can help me figure these out or
tell me who to call or e-mail, I'd appreciate it.

-- thx from an old-time CoCo/OS9 user, Paul Seniura (in Okla. City)

AIUI Hisoft sold STF the rights to Arabesque Pro, without actually
having the rights to do so. This is certainly the story that I've heard
from several sources.

I'm in no way justifying what happened - just trying to clarify how it
happened and who was and wasn't at fault. IMO the situation stinks and
was wholly unfair to your company.

Could my a result of the new faster IDE routines, which obviously are
somewhat slower on some drives with not-so-intelligent firmware. What
kind of drive do you have?

Anyway, you should contact Hans-Dieter_Jankowski@UN.maus.de, who's
responsible for the driver stuff.

2307. Re: Color emulation on a mono monitor...

Newsgroup: comp.sys.atari.st
Date: 1994-11-05 21:06:32 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HJ4E3OB1Z68YB6OU@SNYONEVA.CC.ONEONTA.EDU>
Source record: 177479

There was (is) at least one program that can emulate a color display
at 320x200 display on a mono monitor.

Its called OMNIRES and was a commercial package. It also could emulate
a mono display on a color system. Its an old program and was sold
commercially so I can't attest to its availability anymore.

I'm also not sure if the excellent German SW program EMULA could emualte
(emulate!) a color display...worth checking out though...

Be advised that even if you get one of these emulators to work, they will
probably have a number of caveats such as S L O W screen performance,
unstable compatibilty with programs that directly write to the screen, and
poor low res display quality since mono displays on the Atari can't give
you true grey scales (a limitation of the ST's hardware).

Hope this helps.

PC people can be hilarious. I remember running a demo on my 130XE last year. The PC Owner who observed said "That's good, but my 486DX with VGA graphics is better." I replied by telling him that the graphics and sound chips were circa 1981 and he flipped! Then I said compare the graphics and sounds with '81 PCs. He thought about it and took back his statement.

So, why didn't you take legal action? Seems like a pretty clear-cut case.
And with substantial lost sales, it seems that the financial motivations
would be pretty high?

When there are no repercussions for actions such as these, what's to stop
somebody from doing it again?

No! The FSF sells GPL'ed software, so do Cygnus. There's also a dozen or
so companies that sell Linux. I doubt you will make a lot of money selling
GPL'ed software for the *Atari* platform, though.

> We will always try and keep that option open. But the first version

>This could also affect the other firms like Compuserve, Delphi etc...

It will almost defintely not affect Compuserve and Delphi (as Gordie
so kindly stated). As for Compuserve there already exists a windows
type interface _and_ a ansii type emulation both in harmony. CIS being
what it is will most likely not do something foolish (IMHO) as drop everything
just to run on windows. I'd think it would be a very ridiculous thing for
Genie to do as well, should it do it (which I hope they don't, of course
I haven't read the latest issue of genie lamp)

I've just downloaded 1st-guide from a Umich mirror. I can't get it to touch
mpeg files though. All I get is 'The application failed to find the
file/directory you selected' type message. This is on a TT in TT-Med.

Also is there any English documentation around for it?

Thanks

Roland.

There have been similar announcements/rumors on Delphi. There will
be a GUI on Delphi, but it will not wipe out the text-based stuff.
The GUI is in addition to the existing set-up, AFAIK.

2321. Speeding up the FPU in TT

Newsgroup: comp.sys.atari.st
Date: 1994-11-06 12:03:44 UTC
From: jornm@oslonett.no
Message-ID: <39ign0$hkj@hasle.oslonett.no>
Source record: 177673

In one of the later issues of the german magazine 'ST- Computer' there is a description on how to increase FPU speed. It's very simple and it works.

I first tried with 40 Mhz, and the FPU realy ran 25% faster. As the FPU stil stayed cool, I got brave and tried 50Mhz, and it worked too. 50% faster. Still the FPU is relativly cool (< 40 degrees C.) so I might go for 60/66Mhz if I can get my hands on a 60/66MHZ XO.

The speed increase was measured with a simple loop calculating sin(x), where x is increased in small steps 10000 times.

If anyone feels like trying to do the same upgrade, be ware that YOUR FPU might not tolerate clock speeds as high as mine does!!

****

How to do it:

There is a FPU clock frequency selection named W101 (strap-type of switch), which selects 16 or 32 MHZ. It's located near the FPU on most revisions of the motherboard. It has 3 pins, and the middle one (no. 2 that is) is the clock input of the FPU. Just ad a XO close to the FPU and solder it's output to pin 2 of W101.

Finaly, the cheapest source for an XO is to get an defect or old PC motherboard (typical a 386 motherboard) and solder out it's XO. (Who said those PC's couldn't be used for anything serious:-)?

b> magazines)?
I understood that the XtraRAM was only presently available for the ST
series of CPU. They are 'thinking' about the MSTe. A BigRAM board will soon be
released for the MSTe that uses 72pin simm for up to 8 meg additional.
I misunderstood your original post! I felt you were saying that there
was a way of putting an extra 4 megs into the MSTe _without_ useing another
mmu or ram daughter boards, or vme cards.
I wish those German mags were online and in ENGLISH ;^)
Jon
ps btw, those 1-800 numbers dont work in Canada ;(

Ah, but you missed the point; including MiNT plus the MiNT-net stuff
with the GEM WWW browser wouldn't require _any_ MiNT or UNIX knowledge
on the part of the user. All you'd need is a little installation
program that asked you:

host name
domain name
IP address
SLIP (or maybe PPP by then) contact phone number
SLIP login
SLIP password

The install program could take care of everything else, including
putting MiNT.prg, MiNT.cnf, the MiNT-net programs, etc all in the right
places.

The user will need to know the above 7 pieces of information anyway to
make use of this thing over a SLIP/PPP line; they won't need any of this
(or MiNT-net) for browseing documents locally.

>ASCII configuration files are stone age as nowadays any good application
>provides dialog-based support for all of its configuration files.
>Nobody wants to hack around in ASCII files (at least I'd rather not,
>I just want an application to be self-contained).

There's a case for storing the information you entered in your setup
dialog boxes in an ASCII file; at least then if you're technically
minded you can double-check the config file data without having to hack
into some proprietary file format.

All configuration information (IMHO) should be available from a dialog
box, but it should be stored in a plain ASCII file. Oh, and there's no
reason for it to be as cryptic as DESKTOP.INF...

>Yes there is. Precisely because it is stone age too. It requires
>lots of hacking around before it works (the most recent versions you
>even need to compile yourself as binary distribution is not allowed).
>Especially if you want things as MiNTnet.

MiNT-1.11 is going to be released in binary form. It will be MiNT-net
aware "out of the box". There's no reason why your application couldn't
come with MiNT and MiNT-net and install it, and set it up for the user.

>And after days of hacking ASCII files all you have is a mtasking system
>that makes a 030 run slightly slower than some of the 010 based HP 9000
>systems of 7 years ago.

So don't use MultiTOS.

>My opinion is if you leave 'the telnet stuff' to other applications
>(especially the flaky mintware currently around) *then* you will get a
>system that will do a lot of things but all of the 'half assed'. Next
>you propose that we should call TOSWIN for such a session---this will
>really make me roll on the floor laughing. (See the thread 'TOSWIN -
>it's crap... it is!)

So what you're saying is that you'll develop everything from scratch,
and it'll be buggy, and it'll take you years to finish, and it won't be
compatible with MiNT-net (which is the *standard* as far as Atari is
concerned; otherwise, why would the be releasing a binary MiNT-1.11 to

the public?), etc.

I suppose you're going to ignore the TMP environment variable, too, and store all your temp files in the directory with the app? Or maybe just keep 'em all in memory?

>We will have to be able to handle many picture formats anyway when
>these are in-lined. If they're not, then a simple 'Save As...' option
>is a fairly universal solution for a first version of the browser.

The only standard in-line format is .gif and .xbm, both fairly trivial; some .jpg inlines are appearing though there's nothing in the HTML spec that says you have to deal with them (in fact, the HTML spec says if you find something you can't understand, just ignore it).

>As far as telnet is concerned, this is not essential for a web
>browser. One hardly encounters links to telnet sessions. Most
>important are http and ftp.

True, but you get telnet off the gopher: links. If you supported MiNT-net, your telnet could still run while your web browser ran.

>Better have one swiss knife in your pocket than two bags full of
>bottle openers, combs, kitchen knifes etc.

So, what if your Swiss Knife doesn't do everything? You have to go out and find another one. More $$$, more storage, and lots of wasted stuff where the two knives overlap in functionality.

>People buying Mosaic will want an application that runs out of the
>box. They don't want to spend the first 3 weeks Webbing around to get
>the entire MiNT distribution, Gnu C, MiNTnet etc., spend the next 3
>weeks getting used to working with the Mintos system (you know, the
>masochistic one that never leaves the Auto folder...) the next 6 weeks
>to get these compiled, and finding out in the 13th week that it all sucks
>anyway.
>
>(Wow. What a statement. But essentially I think it makes sense)

And chickens can fly.

I guess you've been ignoring all of the dozens of posts stating:

* MiNT-1.11 (which is MiNT-net aware) will be distributed in binary
* there's no reason why your INSTALL.APP couldn't install MiNT, and all the MiNT-net stuff you'd need

There's also NO REASON AT ALL to need MiNTOS.

It sounds like you're making excuses... is it because you don't want to collect this stuff and distribute it, or because you've already wasted some time developing IP stuff and socket stuff that isn't MiNT-net compatible?

>We are aiming at building an application people can buy and use.
>Nobody will pay 30 pounds for a package that will only run well after
>5 other packages are installed.

You're not looking at the big picture. Tell me why your INSTALL program
can't take care of everything for the user? I'd say "free" sockets,
"free" IP, "free" telnet, "free" multitasking, etc would be quite a win
for someone wanting to cash in on the current WWW craze as quickly as
possibles. Or were you planning on offering this for sale in three
years when everyone has moved on to new machines?

The best way to handle inlines is the way NetScape handles it; you can
read through the page _while_ the inlines are loadin, the inlines are
displayed as they come through (works great for interlaced GIFs), and it
loads several inlines at a time. VERY nice.

I must admit I agree with this. I'm a great fan of MiNT. have spent many
a night playing with MiNT-Net, but in the long run a 'shrinkwrapped' WWW
package is what the Atari needs. Most Atari owners just don't have the time
or enery to make MiNT/MiNT-Net work - and I must admit that I always turn
them *off* before doing any real COMMS work.

Well, let's admit it then and say that MiNT, MiNTnet and *especially*
MiNTOS are just toys for the sick minds among us who still remember the
UNIX machines of the early 70s (?- I was born around that time...) and
get nostalgic about those every now and then...

I finally managed to install MiNTnet... but not to run it! Took
me a whole pack of aspirin. But don't expect me to be able to
set up a SLIP line on a null modem cable though. I saved that for
next week!

Why is it that what people seem to find most important of UNIX to
be preserved in clones such as MiNT, seems to be its
user-unfriendliness?

[some smileys may have been useful in the above. Except after half
a day of severy hacking into MiNT, having to reboot my computer
every 4 or so minutes I can't get that smile on my face]

Okay, but this was when I first bought HDDriver, so I didn't know if it
was going to tell me anything or not. I'd say it would make sense if it
reported no devices found and to advise you to check your connections and
that the driver was correctly configured.

It's not _Atari_ that's going to be releasing MiNT 1.11, it's the MiNT
mailing list, along with Eric Smith.

>>I don't like mintnet either. But there is currently no alternative. If someone

How the hell are you going to connect to ftp or http or anything else on
the UNIX systems if you're not going to use sockets?!? That's what
all the UNIX networks speak over TCP/IP!

>Should isn't good enough. And applications supporting xfs become very
>very slow even under single GEM + MiNT...

I really don't understand that comment at all. Applications that
support xfs (ie, anything compiled with the MiNTlibs) run just as fast
under TOS or MiNT as applications compiled with any other library.

>news transport agents work by writing "magic" config files which are of
>a very fixed nature. There also really ought to be a UUXQT type of program.)

The GFA BASIC uucico in older version help; and the new version has a
GEM-based uucico! Sheesh...

>The PC world and in particularly the Amiga world have quite a lot of
>UUCP/Mail/News software that is interoperable (i.e. various programs
>from different programmers work together without too much hassle),
>without requiring that one completely change the character of your
>operating environment and system setup, which is something that using
>MiNT etc. *does* force you to do.

It's really a pity that Hermes and UPoint don't use standard UUCP files,
etc, or we'd be in the same "shape" as the PC/Mac. Someone could always
port UUPC to TOS; after all, if it works under DOS, it'll work under TOS
(barring any stupid PC-specific garbage in there... can't imagine it in

this sort of app, but I wouldn't put it past them). UUPC's been ported
to OS/2 as well, but OS/2 has some DOS-style foolishness under the hood
as well.

Just a couple more thoughts...

But you think you're qualified to _write_ a networking package?? If it
takes you longer than about an hour and a half to install MiNTnet and
run it, you're not exactly a wizard of networking. Maybe you could be
trusted to write a flashy little UI for it, but...

>Why is it that what people seem to find most important of UNIX to

Yep, user-unfriendliness is the key. Certainly not flexibility,
interoperability, compatibility, or conceptual simplicity.

Why bother,
Steven

ALL STEs have two-chip TOS ROMs located at $E00000 and can all be upgraded to
TOS 2.06 by replacing the ROM chips and flipping two jumper wires.

bye, Peter

2361. Re: Canon Bubble Jet Questions??

Newsgroup: comp.sys.atari.st
Date: 1994-11-06 23:44:00 UTC
From: Peter_Missel@m4.maus.de
Message-ID: <199411070144.a34583@m4.maus.de>
Source record: 177405

>How good is the Canon BJC4000 color printer. I'm thinking of picking
>one up and want to know how it works with an ST. Any help would be
>appreciated.

It's GREAT! It comes with a 4-color print head, carrying a CYM cartridge with 24 nozzles per color and a black one with 48 nozzles. Optional is a 128-nozzle black-only print head. A storage box for the unused of these two print heads comes included with the printer.

Results are stunning, even on crappy laserprinter paper images come out nice and sharp, even in color.

It prints bi-directionally and has three quality modes: Draft, Normal and Fine.
In Draft mode, every other dot is left out, giving lighter printouts and half the ink consuption.
Normal mode is all dots printed and no special tricks (see below).
Fine mode prints like Normal, except that a special line overlapping technique is used: Color print head: In the left-to-right pass, the lower part of a line is printed, omitting every other pixel; the right-to-left pass prints the omitted pixels plus the next half line, again omitting every other pixel. Black print head: same, but with four passes.

All modes are available any time, switchable on the printers' panel.

The color print head has the four colors vertically separated, so that every color ink has enough time to dry out before the next color is printed over it. It prints black first, then cyan, then magenta and finally yellow.

With the black head installed, it prints two lines at a time (that's 1/3"), and can be set to 720x360dpi with resolution enhancement (edge removal) using a DIP switch.
"Draft" is 128-nozzle omit-every-other-pixel.
"Normal" is 128-nozzle with or without edge removal.
"Fine" is 128-nozzle with line overlapping (it's four-fold overlapped!).

The printer has emulation auto-detect. One can send Canon BJ, IBM 24-pin or 9-pin, Epson 24-pin or 9-pin stuff and the result will be OK. (9-pin stuff will look a bit weird, but doesn't a 9-pin printout always look weird?)

To round that all up, the thing is ridiculously fast. 5 pages per minute in Draft or Normal mode using the Black head is what Canon says, and from what I've seen is true.

bye, Peter

2362. Mint, Minix? (why/what??)

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 00:01:27 UTC
From: hallvart@ifi.uio.no
Message-ID: <39jqon$q1k@holmenkollen.ifi.uio.no>

av> Support Mosaic request, and 75% of these said: don't bother, I don't
av> even *want* to run MiNT.

I think mint 1.11 will come out.
Anyway, I have seen all the replies since then, and agree that most
users want a MiNT-less version.

av> MiNTnet has all of that, yes, but it also has a large amount of
av> unpleasantness to it: MiNT.

Well - that's your view. I think mint is *very* nice. But then again -
I like unix. Either way - mint in the auto-folder, and no gem.sys
won't slow you down much. More like speed up quite a few important
tasks like disk io (minixfs), text output (/dev/fasttext or vcon).

av> >So - nothing is stopping you from including mint and mintnet (+ an
av> >easy-to-use-even-for-lusers installation program) as long as you follow
av> >GPL.
av>
av> Which would mean we cannot ask any money for the application?

Oh no - of course not. Just don't say anywhere that your customers
cannot give away *mint*. Heh - the GPL is quite nice actually. It lets
you even charge real money for GNU or GPL'ed software - as long as you
don't hinder your customers in giving it away for free.
You can ofcourse hinder *your* software to be given away...

av> >MiNT+MiNTNet is/will be the standard OS extension - like it or not.
av>
av> Nobody will follow the standard - like it or not. Besides, there
av> will really be many standards: Magic in Europe, Geneva in the US,
av> and MiNT in a few small hackers' societies.

Although what you say is sort-of right. *My* definition of "The
Standard" will always be what *ATARI* comes out with. And *ATARIS*
standard is MiNT. Like it or not (tm:).

av> We will always try and keep that option open. But the first version
av> may not *yet* have support for mtasking slowperating system extensions.

Mint does not slow the machine down. Mint + GEM.SYS slows the machine down. Mint + ROM-aes does not slow the machine down. Mint + AES 4.1 slows the machine down somewhat - but is so nice that it is worth it. Too bad it is not available to the public.

You don't have to learn all the features of mint. Just copy mintnp.prg
to your auto folder and that's that. You won't notice it until you
need the extra features.

You want unix sockets ?
Copy sockdev.xdd into your c:\mint folder.
You want slip ?
Copy slip.xif into your c:\mint folder.

Then with avg's "easy-to-use-even-for-lusers" config program, you can
configure your ip-number, organization name etc. in nice gem dialog
boxes. Probably even so nice that it contains a powerful help system
that will tell you what an ip-number etc. is.

That was my thought. I don't see how that could confuse anyone.
Perhaps his configuration program could even copy
mint[np].prg, socket.xdd + friends to the proper directories for you.

I don't see how this could be difficult at all.
The only difficulty I see is supporting macines with 512 - 1024 k
memory. And that will be a problem with or without mint !

Ma> port for use on ST/F030/TT with Mint or Tos. Of course its free software.

Ah.
When you come as far as to the mint/tos version you'd better contact me.
I have compiled X-libraries and clients for mint+mintnet. I have also
compiled a server, but it bombs during at boot time. This was back in
may-june, and there has been so much else to do that I've put the
project on ice and stuffed the source on a DAT. But tell me when you
start working.
Basically the only trouble I ran into when compiling clients/library
was getting a decent /lib/cpp for imake. I found the cpp from gcc
1.3.something (the one with source on the gemini cd) worked fine.

Anyway, if your linux-server code is available by ftp, I'd like to
take a look at it - maybe it will spur some new interest from me...
:-)

Good luck with the bitplanes !

I was told by Tom Harker (president of ICD) that another version was in the works.

To be honest, I haven't had any problems that I could blame on the ICD software since version 6.0.8. It is good stable stuff, and has been for some time. The little nifty new features are nice, though.

MS Word does not exist for STs, MS Write was introduced long ago, but it is rather buggy. If you'd like to try it, I've been trying to sell mine for awhile. I have a feeling I'll eventually be strapping it to my skeet-thrower, though :-) As far as I know, that was the only Microsoft product ever for the ST.

Word Perfect ST is roughly equivalent to WP 4.1 or so in PC-land, but it can display text attributes right on the screen instead of using different color highlights (italic, bold, etc.). Someone used to WP on PC should feel right at home. I think there are a few minor bugs in the last version released, but nothing major.

You might want to look at Marcel on atari.archive.umich.edu. I have heard that this is a good one. Also, the later versions of 1st Word look quite nice.

The big cut, when it comes to ST word processors, is if they use a bitmapped graphic representation of the printed page (WYSIWYG), or if they just use the system font on the screen (WP, 1st Word, etc.). The former arguably give the user more of an idea of what the document will look like, and allows the use of more fancy fonts. The later is generally much faster in terms of typing response and screen redraws, take up less memory, etc. The only one I know of that did both is WordUp. You could select a "text only" mode that used the system font, or a full-blown WYSIWYG environment. I'd use the former for bulk typing, and the latter for final layout and font selection (back when I used WordUp).

Personally, I think it is good to go with a nice fast text-based word processor, which would be fine for routine letters and such, and use a full blown DTP like Pagestream for fancy fonts and graphics (you can still use the text-based word processor to type the text, then import it into the DTP). Of course, this requires two programs and more money, but it is a lot more flexible than a fancy word processor alone. Just my $0.02.

From atari.archive.umich.edu, grab /Utilities/Tosfixes/hsmoda04.lzh,
/Utilities/Tosfixes/rsve_1.lzh, /Telecomm/turbors.lzh. The first is a
software patch that fixes serial bugs in TOS and gives one flexible
serial buffers, the latter two talk about hardware mods to increase serial
speed. Hope that helps.

> possible to use anything above that?

The flow control on the modems should keep things working OK. Obviously,
you are not going to get full performance without some hardware mods, though.
Also, going past 38400 or so on an 8mHz processor is probably not stable.

> Is there any comms software available that support high speeds like this?

Yes. The RSVE mod (by the author of HSMODA04) is directly supported in some
programs, like CoNnect. Also, HSMODA04 allows one to remap new speeds to
existing ones, so you could make the 300 baud button in other programs
really equal 38400, for example. Some other hardware mods have similar ways
to get faster speeds in existing programs.

Since you are in Europe, RSVE would probably make a lot of sense for you.
Harun sells premade units for a very reasonable price, I seem to remember.
You might send him some email and ask (his address should be in the
hsmoda04 docs). Good luck!

2374. MiNTNet?

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 02:37:00 UTC
From: azog@world.std.com
Message-ID: <CyvLxo.3qq@world.std.com>
Source record: 177613

I am wondering whats the deal with MiNTNet? Ive been following it off and on since release 0.22, and have been reading about it here. I downloaded .50 (the latest?), and as others have bitched about, its in source form.

I am wondering why, early releases were in binary form where I could just place the driver in the MULTITOS directory and off we go. Of course, even the early release wanted MiNT 1.10.

Now things are a major mess. To compile the latest version of MiNTNet, I need to patch MiNT to like 1.11hmumble, but theres a bajillion patches to apply, and it still looks like a mess to me. Will MiNT 1.11 be released 'offically'? Why is MiNTNet is source form? Its not like the old Unix situation, where it was never known what processor the resulting binary would run on.

We all run the same base processor, at least a 68000. Granted to be useful with MiNT, an 030 (or at least a bulked up 68k) is almost required.

2375. Wanted: Atari ST games, software!

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 02:42:28 UTC
From: undergnost@aol.com
Message-ID: <39k46k$n4r@newsbf01.news.aol.com>
Source record: 177616

I just got a used Atari 1040ST w/16mhz acc. 4 megs RAM and a 210-meg hd.
I need games!!!

I'm looking specificly for Day of the Viper, any Psygnosis games, Ultima 3
and up, Stunt Car Racer(or is that Stunt Track Racer?)...
I've got some interesting titles for trade, but e-mail me for details.

Thanks,
see ya.

sammcgee@crl.com (Sam McGee) writes:

>Is it worth upgrading to Screen Blaster II. A new installation program
>does me no good.

>Sam

Ive been wondering the same thing, but for $25 (the upgrade fee?),
it sounds like a good deal. The upgrade is software only. From
what I hear, you can edit new rez's, and not be limited by what
the SB thinks your monitor can deal with. Its also supposed to
be faster, and I heard a rumor that it comes with a new VDI

: > NVDI and MagiC are *clones* of Atari/Novell code. If Novell started
: > objecting to people cloning operating systems, then DR-DOS is in big
: > trouble from you-know-who.

: DR-DOS has always been in a precarious position. Think what a "Look and
: Feel" court case againt it would do. OTOH I've heard that DR-DOS (recently
: renamed "Novell DOS") has been scrapped. Novell apparetly came to some sort
: of agreement (so I heard) over who did what in the market place.

Actually, more precicely, MS-DOS is a clone of DR-DOS. Digital research
bought the disk format and OS code from a company and then lisenced it to
Microsoft. Digital Research, or whatever is left of it, still holds the
rights to the disk format and basic OS design.

This is also why TOS uses the same disk format. Digital research used
the disk format that they owned.

This is also why Microsoft never bothered DR. All MS could do is try to
outsell DR.

2379. Re: No More GEnie...

From: markvanwyk@aol.com
Message-ID: <39k7gl$s0l@newsbf01.news.aol.com>
Source record: 177618

In article <39f6o0$bdk@golem.wcc.govt.nz>, sheppard_r@ix.wcc.govt.nz (Roger Sheppard.) writes:

The change in GEnie that will probably cut out Atari support is sad but inevitable. I got a letter from GEnie a few weeks ago promising that they were going to change over to a graphic-interface type system, just like America On-Line. They said it would include support for PCs and Macintosh, just like AOL. Nothing mentioned about Atari. Too bad. Why couldn't they develop support for Atari as well? I suppose the answer is obvious. I quit GEnie a few months ago in favor of AOL. I get AOL on my Mega STe using Spectre GCR Macintosh emulation. As our Atari computers become more and more obsolete, we will continue to be shut out of new innovations. Maybe a letter writing campaign to GEnie will convince them to include Atari STs and Falcons in their new graphic interface system. I'm not a computer programmer, but it would seem do-able. Any suggestions out there? --Mark van Wyk

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <39ka3v$4d6@golem.wcc.govt.nz>
Source record: 177623

```
] Is it possible to use a high speed modem on the STE, such as a 28800
] baud modem?
] I know there are various modifications available, but I would like
] some practical info.
] And since all the comms. software only support up to 19200, how is it
] possible to use anything above that?
] Is there any comms software available that support high speeds like this?

This message is being sent using a 28.8K modem on a 2meg STE, so they
work quite happily! :) However, without hardware MOD's, I can only
get connect speeds at up to 19.2K.

There is a modification which will allow an STx to be able to use
38400 baud by remapping speeds like 300 baud or whatever to 38400
baud. AFAIK this is the "RSVE" mod', which can apparently be quite
tricky to find the bits for. And buying the constructed device
from the author of the software patch costs about 5x what the device
would cost if you made it yourself.

Download HSMOD04.??? for more info'.
```

2382. Re: Overscan modification for STE?

Newsgroup: comp.sys.atari.st

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <39kaak$4d6@golem.wcc.govt.nz>
Source record: 177624

] Has anyone done the overscan modification on the STE with TOS 2.06?
] I would like to know how it works and if it works well.
] I'm using an NEC Multisync II monitor as well.

Doesn't work on the STE. The bit of hardware altered isn't accessable, so it can't be done - unless someone has released an STE hardware Overscan modification which works in a different fashion. I doubt it however.

Try "Monster", "Double", "Bigscreen", and/or "Stretch". These will all increase the screen size on your STE, by creating a "virtual" screen which can be scrolled around. "Double" will also double the x resolution (From memory), in either interlaced (full-screen), or virtual (scrolling) mode.

"Stretch" will make your screen as big as your memory can cope with. The actual size is specified by you. I've had as much as 1500*1500*4 which is REALLY wierd! :) (The GEM desktop even sort-of supports it, as it displays the file-directory in more than one column!)

Message-ID: <39kadt$4d6@golem.wcc.govt.nz>
Source record: 177625

```
] A friend has a TT and is going to purchase a new high speed modem
] and wants to use it to it's full potential.
]
] Any help you may be able to give would be appreciated.
```

On a TT you just plug the high-speed modem into the high-speed port.
(MODEM2 from memory).

You can then either use software that supports the higher speeds, (Connect would be fine on a TT, but it's shareware). Or you could use the HSMOD04 package to remap things so that pretty much any program can use the high-speeds.

2384. ** FOR SALE ** 8-bit stuff

2387. TT for sale

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 06:10:59 UTC
From: ACLAIT@ELECTRICAL.watstar.uwaterloo.ca
Message-ID: <ACLAIT.6.00012E98@ELECTRICAL.watstar.uwaterloo.ca>
Source record: 177631

For Sale:

Atari TT030 Computer.
Features:
-68030 CPU, 68882 FPU, both at 48MHz.
-4 Meg of ST ram.
-1.44Meg Floppy drive.
-TOS 3.06
-130 Meg internal SCSI hard drive.
-CaTTamaran TT accelerator, Boosts the clock speed to 48MHz
135% the speed of a standard TT, 225% the speed of a Falcon,
800% the speed of a ST (if the Falcon and ST have a FPU).
(speed ratings done with GEMBench 3.41 on the cpu speed only)
-Four serial ports (two high speed - upto 115 kBaud).
-Detached keyboard.

Comes With:
-Atari PTC1426 VGA monitor. This monitor is needed to view
the non-standard vga output from the TT. It is switchable
to Standard Vga. You get All ST resolutions and TTlow and
TTmedium on this monitor.
-Geneva Multitasking system and Neo Desk 3.04 (upgradable to
Neo Desk 4.0 for only $25).
-STalker 3, Warp 9, GEM-View 3.05(registered), Cad-3D, and
more... The hard disk is packed with stuff.
-All manuals, boxes, ect.

I am asking $1475 canadian for the complete package. I do not
want to split up the package.

Message-ID: <39kjc1$6v@pacifier.com>
Source record: 177630
Cross-posted to: comp.sys.atari.st,rec.music.makers.marketplace

Atari-ST MIDI software for sale

Dr. T's COPIST: V1.5 -- Notation Software $10

Dr T's FX PAC-1 -- effects processor editor/librarian: works with SPX90,SPX90II,LXP-1, DSP-128 & Multiverb $20

MIDI DRAW by Intelligent Music, draw with mouse & artwork is "played" back by your Midi synths (does not work with STE) ...$20

OMNI-BANKER ST -- Universal Midi Librarian, patch/bank librarian covering LOTS of synths $20

SynthView Editor/Librarian for the Korg DW/EX8000 .....$15

SynthDroid Editor/Librarian for the Korg DW/EX8000 .....$15

GENWAVE, sample editor supporting: Emax,EIII,SP-1200,SCI Vs, 2000.2002,3000,Yamaha TX16W, Roland S50/550/330, Korg DSS/DSM, Dynacord ADS/ADD-1/2, Casio FZ-1,10M, Ensoniq EPS, Peavey SP (via Midi sample Dump), OBERHEIM dpx-1 & Prommer, Akai S900 (12 & 16 bit),S950/1000, Frontal Lobe/PCM Channel and it supports SDS!!

Quoting directly from the December, 1994 issue of Keyboard Magazine:

" ....You actually get two programs: Genwave/12 talks to 12-bit samplers, including Akai S900/950, E-mu Emax, Korg DSS/DSM [etc etc]......Genwave/16 talks to 16-bit samplers including...Casio FZ series, Roland S-770/750 [etc etc].......On several samplers, real-time loop editing is supported, so you can hear you edits directly out the sampler as you make them.....The looping screen is thoughtfully designed with two waveform windows, a close-up view and a full overview. A pointer marks the area on the overview that's currently under the microscope. The windows are linked, so as you scroll the close-up view, the arrow on the full view moves.....Both GenWave/12 and 16 feature EQ, enveloping, and FFT spectrum analysis; Genwave/16 also gives you sample-rate conversion, time compression/expansion, time-variant EQ drawing, a noise/sine generator,and pitch detection and drawing. Importation of Macintosh and Atari ST Sound Designer files is supported."

I was even able to get Genwave to work on my Falcon in ST MODE. $150

all programs have the manuals ..... Buyer pays shipping, will ship C.O.D.

The current situation with Mint/Mintnet/Mintos is a pain. You need
to download megabytes of source just to get a reasonable facsimile
of a BSD unix system in terms of filesystem hierarchy and executables.

Until stable versions of MiNT and Mintnet (MintOS seems reasonably
stable, ATM) come out in binary form, nobody's going to take the
plunge and build a binary distribution with GOOD installation
scripts which will work more or less out the box. Personally, I
have my doubts that _anyone_ will want to be so adventurous as to
build such a distribution! Unless of course anyone's interested in
a tarfile of my / and /usr filesystems! ;-)

Cheers, Steve

I recently downloaded MintNet 0.5 pl5 (the latest version) and there were
binaries. Earlier releases i've downloaded have also contained both binaries
and sources...

Try atari archive; their package contain both binaries AND sources...

There can be a number of problems, but get DC Format 3.3 I think is the latest
version..

The other things are 10 sector disks and twisted formats, both can be problems
with MS DOS....

Hi Joachim,

SJ>The only thing is that with 2.20 there is 'til now no possibility to
SJ>switch between compression / non-compression mode of the HP DAT.
And this will never be build in, I believe.
It's not good to insert features for only some streamers. It's no long time, and there will be a user, telling GEMAR does not work at all, because he switched any parameter to a vendor paramter for any streamer, but not his streamer.

As far as i know you can backup uncompressed by using an uncompressed initialized tape. So if you want to change data between your system and another system with a noncompressing drivem, you can initialize the tape on the noncompressing drive. This tape will be used uncompressed on the other drive, too.

The other possibility is a plugin for the streamer to cach for loading the tape. There you can switch compression as you want.

I do not have a drive to check for function, but it's really simple to write a plugin for this feature.

Ciao, Steffen

WANTED: Inexpensive, used SCSI Tape Backup. Must do at least 525 Megs
without Compression. Should use a Tape that is standard enough that it won't
go the way of Beta. SCSI or SCSI 2. I will consider all offers that come in.
must have information on Drive including Make and Model numbers.

Please Direct all replies to bensmith@teleport.com in E-Mail.

--Thanks--
---Ben---

Roland Givan (rgivan@cix.compulink.co.uk) wrote:

: This has to be one of the biggest problems us serious Atari users face :-(

sad but true. :-(

: PC minded people can be very blinkered. Often I am asked what sort of
: computer I own. The expected answer is 386 or 486. When I explain I have
: a TT, their faces just go blank. Then I move onto the technical spec. They

When I say ST...they go..Oh a games machine!!!!! Truth is that PCs are
mainly used as games machines at home...so I think they are just
talking b**ll***t.

: Luckily I invariable know more about PCs than the PC owner I am talking

Same here...more than the average spotty, business suit wearing PC
owner.

: to. The line they generally fall back onto is the amount of software you
: can pirate for the PC, compared to anything else. This argument doesn't go far
: with me ;-)

Thing that gets me, is that they always say, if they could afford it,
they'd buy the software. My arguement is, if you can't afford it, then
go PD. You don't generally need all the nice things of these latest
commercial packages....

If you can afford it, then you will probably be in a business, or some
such thing. If you can't afford it, then you are not in a business or
something, and thus only need say, a WP for the occassional letter, or
something.

So why pirate?

: Piracy of software is what keeps the punters buying PCs. many PC owners
: I know just won't contemplate buying software. Why bother when you can

Something even more surprising is the numebr of PC resellers which give
you pirated software when you buy a machine from them. Roland will
probably have already read what I am going to write, as I mentioned it
on cix.

I went into a PC resellers place, cos my cuz was told to buy a PC for
someone. The guys were giving away a copy of Windows for Workgroups
with ever PC sold. The thing was that the software was not even
licenced. They had bought a personal copy, and were copying it like no
ones business. Also in the offer was Microsoft Office totally free,

again pirated. They even asked if we could get any software for
them....

Started to talk about shareware, and stuff, and I asked if they paid
for it....obvious answer....who is stupid enough to pay for that. I
asked if they used it, and they say...yes, shareware is good...in some
cases, better than the commercial stuff.

So why could these guys (who own a shop) not pay something like 20
pounds toward something they use?

Is this the average mentality of a 'IBM PC and compatible' user?

: always pirate it. Even with CD-ROM, CD-R units are dropping so much in
: price that CD-ROM piracy will be rife by this time next year.

Seen the latest Sony one, for 500 pounds? I reckon that by February,
they will have come down to around 200. Not a bad price...especially
for a back-up unit....and you can use it as a CD drive.

: they are just not interested. Somehow the view that unless you can do it
: on your own PC, then it isn't worth it - is prevelent.

Yes. I see that too. Especially with some of the PC psychos in the
department.

: I can great satisfactiong from telling people that I have Windows on my
: PC and don't use it. Not becasue I don't know how - but that it

I think I surprised my cuz when I said that too...in that I would not
run Windows or DOS on my machine. Maybe have it there for some
stuff....but otherwise not touch it.

: intrinsincly hammers the machine. A lot of the time my Pc is used as a dub
: terminal to a Unix machine anyway.

Same as me then. ;-)

Yes it would! However there are only four patches:
mint1.10-1.10h8
mint1.10h8-1.10h9
mint1.10h9-1.11h1
mint1.11h1-1.11h2

Anyone want me to upload the sources to 1.11h2?

Papyrus is tricky to update, 'coz each Papyrus master disk is
seriallized. There is no such thing as a single 'updater' program, ROM
need to send a new disk. Anyway, that's what Hisoft say ;-)

But in general a smart idea - just ensure the updates are on Internet
sites, not bulletin boards etc.

It caches the loaded fonts, so when a second app calls vst_load_font
it doesn't read everything in again. It also creates a cache file
which it reads on boot up, thus speeding even the first vst_load_font.

Some versions of Speedo 5 break with some TrueType fonts; later
versions (5.0c) are supposed to be OK.

1. Although the MintNet drivers are freely available, binary versions
of Mint 1.11 are not. I'm not holding my breath for a binary 1.11.

2. Kay is porting MintNet to MagiC 3.

3. We will support MintNet/MagiCNet *where available*, but will have
SLIP networking built in to support the users who do not have nor wish
to have, Mint/MagiC.

If it's not too much trouble. I haven't managed to patch the source
successfully yet - I got an illegal instruction when applying one of the
patches, patch keeps saying it can't find a patch in the file, then working
again later, and I'm getting a few hunks failing.

>Has anyone any experience with the Speed-resolution card ?
>I'm thinking of buying a accelerator,and i'm told that the speedres
>card is quite fast.I need some more info.Can anybody help ?

Basically it increases the bus speed from 16Mhz up to 20, and doubles the
processor clock to 40 (or to 32 if you switch off the bus doubling).

It's not that fast, but because it increases the bus speed it is better than
something like the PowerUp32. The best you could hope for is a little over
150% I should think.

In terms of graphics it isn't much better, but that little bit makes all the
difference, allowing 800x608x256 and 640x480x16bit.

Some people have had problems running in 40/20Mhz mode, and find that which is
best to use of 20/20 or 36/18 depends on the application.

Can this be used in place of Screen Blaster or something like that ?
Or can you use just the software versions of these ?

All I want is to get 640x480 in True Colour mode on my VGA monitor.
I'm happy with the other resolutions.

How much is this card in the UK ?

Cheers,
Phil.

Hi!

I need help with Linux, I tried to install it but I ran into some problems:

1. How do I mount an Atari HD partition?

2. After installing the root into my HD and editing the fstab file I rebooted
and ran Linux with bootstrap root=/dev/hda2 ro, which is my boot partition
but it didn't work very well because I got a couple of error messages saying
things like files are missing and that something is wrong with /proc
but then the big blow comes: KERNEL PANIC BUS ERROR...

3. Does anyone run Linux out there??

Please help me...

Cubase comes with a very good manual which you should have received
with the package. Get in touch with the place where you bought it
and find out why they did not supply the manual.

When I try to run Calamus 1.09 on a Mega SPath: lise.unit.no!josk
Newsgroups: comp.sys.atari.st
Distribution: world
Followup-To:
From: josk@Lise.Unit.NO (Jo Even Skarstein)
Organization: Norwegian Institute of Technology
Subject: Problems with Calamus /UK Tos

When I try to run Calamus 1.09 on a Mega STE with UK TOS 2.06, I just get
a message "Calamus doesn't work on this TOS". I've got the same problem with
my Falcon with UK keyboard driver installed. When I use the german keyboard-
driver it works fine, go I guess that it is the keyboard-driver that causes the
problem. Does anybody knows how to fix this?

Papyrus Gold is basically a clone of Microsoft Word 4, with a ton of new features added in (which feature wise make it very close to Word 6).

The cost of taking legal action in a foreign country (UK) was and is
simply prohibitive for a small company like ours, especially after having
lost one of our revenue sources.

: Craig.

I think Tautology supports the Joypad. Hey I know for sure that there is
a little util called PowerMouse which lets you use the Joypad instead of
the mouse and all the buttons do different things like Double Click,
Click and Hold, etc... :)

How about a Joypad library for Hisoft Basic? :-)

The Apple CD300e (the new version), for example, can send the audio over the SCSI. Perhaps cdaudio.prg is just a panel for managing the CD and cannot map such audio data to the Host audio out.

> tricky to find the bits for. And buying the constructed device
> from the author of the software patch costs about 5x what the device
> would cost if you made it yourself.

The info here is a bit jumbled. First, there are a number of hardware mods, each with differing capabilities (there is one really easy one that gives 38400 only, RSVE is more complicated but can also give much higher speeds). Second, the ability to map new speeds onto old unused ones is done through software (hsmoda04, in fact), not hardware, and can be experimented with before doing any modifications, if desired. For example, there are some programs out there that only go up to 9600 baud, and hsmoda04 can be used to get 19200 in these programs. In the directory /Utilities/Tosfixes, check out 38400.lzh, fser096b.lzh and rsve_1.lzh. In /Telecomm, check out turbors.lzh. These are all the hardware serial mods I know about on atari.archive.

I'm not sure how hard it is to build an RSVE board, but the author sells a super-tiny version for less than 100DM (could be much less, like 50-60DM, I cannot remember). Either price is pretty cheap IMHO. Compare this to the cost of a PC fast serial card, or even a Falcon/TT upgrade :-). For 8mHz or 16mHz ST or STE machines, RSVE gives you more serial speeds than the CPU can handle. I think the max for the board is up around 150,000 bps, but an 8mHz 68000 can only really handle around 57600 (if it does absolutely nothing else but process serial interrupts). I presume you could approximately double that for a 16mHz CPU. Something like a PAC/33 could probably use RSVE full bore. The RSVE/HSMODA04 docs discuss this in more detail.

I am in no way connected with the author of RSVE/HSMODA04, nor do I own an RSVE board (though I threaten to buy one about once a month).

Look on atari.archive.umich.edu, /Misc/st2dos.zip. This is a PC program
that rewrites the ST bootsector with a proper PC one, and thus should do what
you want. For an ST program, try DC Formatter in /Utilities/Dc. Hope that
helps.

2434. Help with Xferring Atari FTP Files

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 15:48:19 UTC
From: bd@st-andrews.ac.uk
Message-ID: <39li83$co0@calvin.st-and.ac.uk>
Source record: 177584

Help!
I'm new to this newsgroup, so please forgive me if I'm asking something that has already been asked.
My problem is in successfuly transferring Atari files from anonymous FTP sites.

I am using an apple LCii. I manage to get the files from the FTP site to the Mac with no problem. I then use Mac FileTransfer to transfer the files to an MS-DOS format disk, and then take this to my ST. The files are there, but when I try to dearchive them (and this happens with both ZIPped and LHarced files), I just get lots of errors (the most common being a CRC Checksum.

I am aware that the CRC error is a Cyclic redundancy checksum error, and that this probably means the file has been corrupted at some stage.

If anyone has tried something similar, and succeeded, I'd be very grateful to hear from you..

Thanks in advance,

Brian(bd@st-and.ac.uk)

Source record: 177592

Hi, I've searched high and low for a program called either 'Drivert' or 'Divert' that supposedly will allow me to switch drives A & B through software. My problems with drive A have now made it impossible to use the NeoDesk 4.0x to 4.04 patch because it (of course) insists on having a disk in drive A (arrgghhhhhhh!-). Apparenly a program called pchrome was supposed to have this program with it (or so I was told), but no such luck in the two versions of pchrome I downloaded... BTW, thanks to all who have helped with this problem in the past. Maybe I'll have to break down and do the hardware mod instead, but I prefer a software solution (of course).

So, could some kind soul please tell me where, and by what filename, to find this software? Thanks!!!!!!

Toodles!-)

2445. Prospero FORTRAN still supported?

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 19:26:32 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <Cywwo8.EpH@watserv2.uwaterloo.ca>
Source record: 177514

I recently acquired Prospero FORTRAN (TT version) and I have a few
questions:

1) Is Prospero software still in business?

2) Do they still support this product

3) Is the address on the registration card (190 Castelnau, London UK)
still valid

4) My version is mmt1.108 (TT). Is there a more recent version?

5) Are there updated GEm bindings for AES 4.x or do I have to
these myself?

I do a lot of consulting work in FORTRAN (don't ask) so I thought
this would be a good way to stay home and work :-). It is a very
complete compiler and I just want to make sure I have the latest
one - the README file is mid-1992 so it's not that old.

Thanks,
Sam

In general you will notice before you leave your AUTO folder. I have
installed MiNT several times, and usually it takes a few hours to
set everything up to run without problems.

Unless you really mean to say: empty your AUTO folder, and add just
mintnp.prg...

>You want unix sockets ?
>Copy sockdev.xdd into your c:\mint folder.
>You want slip ?
>Copy slip.xif into your c:\mint folder.

You want to USE slip? Prepare for a few days of hard labour :-)

>Then with avg's "easy-to-use-even-for-lusers" config program, you can
>configure your ip-number, organization name etc. in nice gem dialog
>boxes. Probably even so nice that it contains a powerful help system
>that will tell you what an ip-number etc. is.

Yes, that is what we're aiming for.

>That was my thought. I don't see how that could confuse anyone.
>Perhaps his configuration program could even copy
>mint[np].prg, socket.xdd + friends to the proper directories for you.

This would be really hard to do in a fool-proof way. Anything wrong
in the auto folder and the system hangs (forever, if you're a naive
user...)

I agree.

>MiNT-1.11 is going to be released in binary form. It will be MiNT-net

You forgot to add 'hopefully'.

>aware "out of the box". There's no reason why your application couldn't
>come with MiNT and MiNT-net and install it, and set it up for the user.

[...]

>So what you're saying is that you'll develop everything from scratch,
>and it'll be buggy, and it'll take you years to finish, and it won't be
>compatible with MiNT-net (which is the *standard* as far as Atari is
>concerned; otherwise, why would the be releasing a binary MiNT-1.11 to
>the public?), etc.

Atari is too much 'dead' for still having one standard. As anyone
knows, there are some 3--4 standards around today.

>I suppose you're going to ignore the TMP environment variable, too, and
>store all your temp files in the directory with the app? Or maybe just
>keep 'em all in memory?

The TMP variable doesn't have a meaning on the Atari. It is UNIX.
Here's my objection to MiNT: it blindly adopts 90% of UNIX. I wish
people had used some more phantasy.

>>As far as telnet is concerned, this is not essential for a web
>>browser. One hardly encounters links to telnet sessions. Most
>>important are http and ftp.

I agree.

>True, but you get telnet off the gopher: links. If you supported
>MiNT-net, your telnet could still run while your web browser ran.

I presume you planned to use TOSWIN as a front end? Ugh.

>So, what if your Swiss Knife doesn't do everything? You have to go out
>and find another one. More $$$, more storage, and lots of wasted stuff
>where the two knives overlap in functionality.

That's what commercial developers earn their living with, isn't it?

>I guess you've been ignoring all of the dozens of posts stating:

>* MiNT-1.11 (which is MiNT-net aware) will be distributed in binary
>* there's no reason why your INSTALL.APP couldn't install MiNT, and
> all the MiNT-net stuff you'd need

I haven't ignored those. They have made me sick, and that's why
I am being a bit agitated on the news. MiNT 1.11 may not be available
at all, as Atari have dropped the 68k line and will never find it
worth the time and effort to do even such a simple thing as to write
that GPL licence.

It would be *very* hard to write an install program that installs
MiNT and MiNTnet so that it works on any system.

>It sounds like you're making excuses... is it because you don't want to
>collect this stuff and distribute it, or because you've already wasted
>some time developing IP stuff and socket stuff that isn't MiNT-net
>compatible?

I am merely investigating my options. My conclusions so far are that
from a programmer's point of view it is definitely easier to go for
MiNTnet, but from a user's point of view, it seems that built-in
support is more important.

>You're not looking at the big picture. Tell me why your INSTALL program
>can't take care of everything for the user? I'd say "free" sockets,
>"free" IP, "free" telnet, "free" multitasking, etc would be quite a win
>for someone wanting to cash in on the current WWW craze as quickly as
>possibles. Or were you planning on offering this for sale in three
>years when everyone has moved on to new machines?

I don't want to participate in a project that makes every Atari
look like a bad imitation of a UNIX box. If that's what you want,
get a cheap 486. Atari must remain Atari at all cost.

Does anyone know of serious poker software for the ST? I enjoy the game
but rarely get the chance.

Also there was a game being developed in Germany several years ago called
"Wallstreet Wizard" I believe. Does anyone know if it was ever released
in English? I sent a letter to the company but never got a reply.

>Yep, user-unfriendliness is the key. Certainly not flexibility,
>interoperability, compatibility, or conceptual simplicity.

That's right. User-friendliness first, then the rest. UNIX is
fine where flex, inter and comp are concerned, but if the user
interface stinks then it ends up being useless except to a few
scientists who know how to use it.

I don't use a Mac but have transfered files from an ftp site to a Unix box
then to a PC then to my ST. Only the last part is via floppy, while the rest
is via FTP program. Your problems sounds like you did not use BINARY file
transfer for your ftp. Try typing 'bin' on the ftp prompt.

> When I try to run Calamus 1.09 on a Mega STE with UK TOS 2.06, I just get
> a message "Calamus doesn't work on this TOS". I've got the same problem

I think som German programs check the translation/scan code table for some keys. I run 1.09 with TOS 2.06, but I use the new keyboard layout that have the E with ' and the U with " on the same plave as in Germany...

Anyway... My keyboard driver NORKEY5 and NORKEY6, and the Atari Norway driver NORTAST1 (all three written by me) all support this setup, and the programs are small and completly free - just mail me a request !!

> If no....does anyone have source to an ST program that does the same?

Immunize the disks with Protect6 or another anti-virus program that writes
an IBM bootable bootsector. It's only a few bytes at the start of the
bootsector that needs to be changed to allow MS-DOS to read the disks.

If you don't have PROTECT I can mail it to you (It's very small).
Just give me a hint !

```
FIRST CALL FOR VOTES (of 2)
unmoderated group comp.sys.atari.programmer

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

Votes must be received by 23:59:59 UTC, 28 November 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing lists lexicor-list, gem-list mailing list, gem-magazine.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

HOW TO VOTE

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.
```

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.programmer
I vote NO on comp.sys.atari.programmer

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and votes of all voters will be published in the final voting results list.

2460. Magazine Blow Out Sale!!!!

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 23:32:40 UTC
From: Mark Santora <santora@delphi.com>
Message-ID: <Je5Wzlw.santora@delphi.com>
Source record: 177509

ATTENTION:

Prepare yourselves for the BIGGEST MAGAZINE BLOW OUT you've ever experienced!

PLEASE NOTE: Each magazine is for sale as a SET ONLY. I will not break them up.

FOR SALE:

Electronic Games(2600, Intellivision, Coleco)
-this is the Original folks! I have sparadic copies of this mag and I am looking to only sell them as a SET.

EGM(current)
-what can I say except I have them mixed from when they were bimonthly.

Atari Explorer
-the sparadic inhouse atari mag. mixed issues.

ST Log
-Analog's ST mag.

START
-Antic's ST mag.

Current Notes
-The hands down BEST Atari mag, ever. Written by users for users.

ST USER (European)
with disks

ST FORMAT (European)
with disks from issue #1!

ST ACTION (European)
with discs

STARLOG
Since Issue 35 to about 2 years ago. Good to excellent quality.

There are more still burried in my basement, I will add to the list as I find them...

If you are looking for specific issue numbers, write me back and I will email you specifics on each mag. This is an AUCTION. I will update it weekly for the the 3 weeks! This auction ends on November

31st.

I guess they have lots of stuff, but not many customers. :-(If they
were serious about business, they should probably branch out
(personally, I'd love to run a store that sold only 'A' things... Atari,
Amiga, Apple).

2462. Re: Opinions on Microsoft Word and Word Perfect?

Newsgroup: comp.sys.atari.st
Date: 1994-11-07 23:49:11 UTC
From: jwatkins@cix.compulink.co.uk
Message-ID: <Cyx8tz.437@cix.compulink.co.uk>
Source record: 177504

>Can anyone give me an opinion of the ST versions of Microsoft Word and
>Word Perfect. These are "premier" word processors in other platforms and

There is no version of Word on the ST. The nearest you can get is a version of Write (c1987) - which pre-dates the Windows v3 version. It's OK, but not worth chasing after. It isn't file compatible with any PC or Mac version (as far I can find)

Word Perfect on the ST is stuck at v4(.3?) - people seemed happy with it at the time. AFAIK it is file compatible with PC versions.

Bye,

John.

I 've been working with the German Program "Starcall" from Ingo
Linkweiler.
It is an Shareware-Prog and works with a "Volksmodem" to. It has many
Options (VT 100 and so on). Also it hat an direkt-Option for an Mailbox-
programm (Starbox) and an Fax-program (Starfax).
I work with these programs on an Atari-1040-ST-e with a 20 MB Harddisk,
and i meen that it is an professional program-paket.
You can take this poket out of many BBS in German, but also You can

post the programmer over the "MAUS-NET" His Call-Phone Number is:
049-02363-55629 in the evening from 19.00 - 23.00 hours.
If it is not possibile, than I can help you with Binaer-load .But the
Programm what I have is not the Full-Version !

> A friend has a TT and is going to purchase a new high speed modem and
> wants to use it to it's full potential.

The TT and MSTE do 38400 quite happily as standard on at least one of their ports. The restriction is normally that the software can't select this baud, although HSMODEM has a workaround for this.

I believe the TT can do 115000 baud, but haven't tried it.

> and get nostalgic about those every now and then...

Well this is how I consider it. It runs a pretty mean setup of GCC. When using my dumb terminal you can hardly tell it from real Unix ;-) OTOH MiNT is a big pain in the neck for those people who don't need it.

> I finally managed to install MiNTnet... but not to run it! Took me

I've been in that situation lots of time. Its always a miracle when my 2 machines will talk to each other under MiNT-Net.

I *know* MiNT-Net is an excellent package - but its not really for the unwashed massess - where as WWW *is*. (IMHO of course ;-)

> preserved in clones such as MiNT, seems to be its
> user-unfriendliness?

Because we're unlikely to get X-Windows running on it ;-)

Not sure about the loadable ROM image. Eons ago, I had a program that would create an image file of TOS, but it was only useful for burning EPROMs as far as I know (I found it on an ftp site somewhere). I got rid of it long ago, sorry.

I have lamented the problems with TOS 2.06 myself (though I done have much choice, as I have a MegaSTE). Anyway, one thing you could do is build a small board so you can switch between two sets of TOS chips. Then, get yourself a TOS 1.62 chipset and you'll be happy (TOS 1.2 or 1.4 will not work on an STE, by the way, so I think it likely that you used to have TOS 1.6x).

I remember recently reading something in this newsgroup about being able to build an STE TOS switcher just by cutting a few traces on the STE motherboard, installing the other TOS in the spare ROM sockets, and installing a switch (I did not read it carefully, but that was the gist of it). So, perhaps someone could send you those articles, or perhaps you could look them up on a site that archives comp.sys.atari.st. The articles I am refering to were posted in the last week or two. Good luck!

> this software? Thanks!!!!!!

It is on atari.archive.umich.edu, in /Diskutils. Here is the entry from the
0index file:

divert13.zoo 4 Divert all drive a access to a hd partition

You can get it via ftp from atari.archive or one of its mirrors (try using
phoenix.doc.ic.ac.uk in /computing/systems/atari/umich or something like
that).

> the past. Maybe I'll have to break down and do the hardware mod instead,
> but I
> prefer a software solution (of course).

I just recently installed an A/B drive switch in one of my STs, and it was
quite easy. If you do it, I suggest that you not try to desolder the
two pins on the sound chip. Instead, cut them off near the motherboard
using side cutters or a Dremel tool (I used the latter, worked slick as snot).
You only need a little "stub" to solder onto, and trying to desolder and
pry out the pins increases the chances of it breaking off. I used a super-
tiny switch from Radio Shack, plus some 30-gauge wire-wrap wire.

I also replaced the internal floppy drive in that machine recently (so I
switched the switch back to "normal" postition, and will probably never
touch it again :-). It is a piece of cake given that you take the time to
find the exact same type of Atari mechanism (long thin eject button, or
small eject button either rectangular or parallelogram shaped). I bought a
SF314 with the correct type of eject button, and did a direct swap with
no problems. Good luck!

2477. Some news...

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 03:53:44 UTC
From: jonal@hiof.no
Message-ID: <jonal.2868.2EBEF648@hiof.no>
Source record: 177549

A few pieces of information from the latest ST Computer (German mag)...

Thought I'd share this with those unfortunate who have to rely on glossy British game mags etc. to keep up with the scene...

* New DMA to SCSI Adapter from Hard & Soft. The SCSI-II-Link is very similar to the ICD Link. Price including SCSI-Tools 6.x: DM 149,- With CD-Tools added: DM 198,-. For the ultimate in CD-ROM, get Erling Henagers Mint drivers, though.

* Mention of Uwe Seimet's new version of HDDRIVER with Bus Arbitration. (Hi Uwe!)

* Surprise of the month!!! Wilhelm Mikroelektronik, makers of the Spectrum TC video cards and the Charly Image software are back under the name of progemtec. The new firm will offer a range of graphics cards I feel will rival the Nova cards in price and performance. progemtec will be offering these cards: Spectrum 1TC (640x480x24) @ DM 348,-
Spectrum 2TC (800x600x24) @ DM 689,-
Spectrum 4TC (1280x1024x24) @ DM 1498,- (similar to Andromeda SuperNova+)
Spectrum 6TC (1600x1200x24) @ DM 2998-, (Presumably 6 megs of VRAM!)
They will also be offering their Charly Image upgrade to 4.0 for DM 98,- and something called the CharlyNet Ethernet module with drivers for Novell and Windows (for Workgroups..or?). Hey! Somebody write a MiNT device driver for this one. THe price if the net thingie should be DM 598,-. progemtec also have plans for making 030/040/060 accelerator boards for * all* Atari models. Looks like I'll have a 060 in my TT next year! No prices yest, with the exception that they will offer 030 cards for as low as DM 300,-. Could any one of you Germans with modem pull off some more info from WMI's mailbox at 02306/ 750158 and upload it to the net? Thanks...

* Whiteline, a cooperative unit of Atari dealers will release a CD collection of sh/w and PD stuff. Should include Linux for our beloved boxes.

* Speaking of CD-ROMs: Wohlfartstaetter has now released 3 discs while Lohrum is at numner 2. Add this to the recent Atari Archive disc, the Canadian SuzyBdisc and the above mentioned Whiteline disc and we're beginnig to get a solid library! Also, several gfx discs with GIFS, TIFFs and even CVGs have arrived onto the Atari scene the past few months.

* Crazy Bits are offering the new Fargo Primera Pro colour printer so I assume drivers are available...

* NVDI 3.0 and Speedo 5.0x are tested and I'm gettin both...

* The Janus card (Atari compatible in a PC) is tested and seems interesting for those who are cursed with Intel boxes at work or something... Lots of ads for portable "Ataris" based on a PC notebook and this card. A bit expensive though, at DM 900,- the card comes clean of both ROMS and RAM.

* Catch Computer offer a 48Mhz upgrade for the TT. Probably some stunt like the CaTTamaran which is handled by Compo over here.

* Calamus SL is down to DM 400,-

* The GE-Soft Eagle is finally appearing (or so it seems...). With a 33 Mhz (yes, it sait 64Mhz, but there are no such thing...) 040,
ACSI, SCSI, 4xseial, Lan, 2xVME, MIDI and a proprietary Eagle Channel, this beastly TT clone retails for DM 3500,- and accepts up to 14megs of ST RAM and 256 megs of TT RAM. I guess the quoted price is without RAM...grumpfh. Compared to the Medusa this seems very competitive as I've only seen the Medusa offered as a complete system starting at DM 5700,- or so. The magazine will have a feature on this system next time (and one on networks as well!)

* The MegaBoard were shown at the proTOS fair: A card for normal ST's which offers up to 8 megs of RAM with SIMM, an IDE HD controller (like the one in the F030) and an ISA slot for i.e. an ET4000 based PC graphics card. This cards comes courtesy of Heyer and Neumann. No price quoted.
Lots of new word processing software: Script 4.0, papyrus 4.0 (I gotta up-grade - even the current one is a killer...) and Gutenberg, a newbie. No! software, the new house for Interface showed Arabesque 2.0 which handles vector graphics in colour. Medusa T60 (68060 based!) were shown for the first time, likewise premiered two magazines, Atari Inside and Invers, the latter being a DTP specific rag. Buy them both!

* Digital Arts showed a complete 3D system, with Raystart as the heart I believe.

Well, it's 4:44 in the morning - gotta get some sleep, guys.

The Suburban Chicago ATarians (SCAT) user group will hold its November meeting on Tues. Nov. 15 at 7:30 PM (7PM setup), at the College of DuPage, Room K157 (the K building is located on 22nd St. just west of Lambert Rd., in Glen Ellyn). We will watch a video of the Summer Consumer Electronics Show (I've been assured that it really will be there this time :-), and we plan to have at least one demo (probably on a TT, whether it be MagiX/MagiC or something else ....). Maybe even a Jaguar!

Everyone is welcome to attend.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

Wondering if everyone using ST's and CD ROMS could give me some
Email account of your experiences and uses.
For instance, is there anything beyond the likes of the Gemini
CD? Given one's individual incarnation of the ST/TT/Falcon, how did you
get your CD Rom connected? Does everyone use ultra-cheap single spin
units without a gripe, or is there a good arguement for spending the
extra bucks on a double or triple speed unit?
Just a few sample questions to answer, but feel free to give any
experience you like!

Thanks!

2481. TOS 1.2 Fixes?

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 06:00:45 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <Cyxq1A.IGt@watserv2.uwaterloo.ca>
Source record: 176916

Hello all,

I just picked up a complete Mega 2 system for my sister to use
for word processing - it is:

Mega 2 ST TOS 1.02 (22/04/87)
SM124 Mono monitor
SH205 20 meg Hard disk
SF314 Floppy

I got it all for $150 Candaian (~$110 US) which is a pretty good
deal I guess. I am now setting it up for my sister but since I've
been using a TT for so long, I've forgotten the fixes I need.

I need some sort of FAT caching. FATSPEED screws up (I don't know
if it conflicts with anything else in the auto folder). Whenever
I try to write to the HD with FATSPEED installed it says the
disk is full. It works fine (but VERY slowly) without FATSPEED.

Is there another program that performs the same task but is maybe
more reliable? It runs as the first thing in the auto folder. I
also have Pinhead 2.1 and Headstart 1.1 installed.

Any other fixes necessary (I have FOLDRxxx installed)?

Thanks,
Sam

From: markvanwyk@aol.com
Message-ID: <39n6g9$2o6@newsbf01.news.aol.com>
Source record: 177534

In article <39k7gl$s0l@newsbf01.news.aol.com>, markvanwyk@aol.com (Markvanwyk) writes:

I might also mention that when I had GEnie, I was able to download and run the the full graphical version of "NTN Trivia" (I think it was called) and "QEB Football" (I think it was called) on my Atari Mega STe. They have specific Atari versions of the software on line which are required to play those very sophisticated (and expensive - - $8 per hour) nationwide interactive games. The Trivia game is not only available on GEnie, but can be found in many bars and restaurants throughout the U.S., with hundreds of participants playing at the same time. The same with the Football game, in which the participants follow along with an actual NFL football game on TV and try to predict plays. The graphics were very impressive, with numerous box scores and message boxes on the screen. The point is, if they could create this kind of graphical interface for Atari computers for these games, why could they not create similar interfaces to go work with such on line services as AOL, the new GEnie, etc.? Atari computers certainly are capable of handling these kind of graphics. Or is this just another losing battle?

This may work - I haven't tried it - but I ftp to src.doc.ic.ac.uk
and go to the directory computing/systems/atari/umich.
Possibly this is because there is more than one way to ftp.

Hello,

Is there anybody out there who knows any stores in The Netehrlands,
which sell Atari ST stuff. I am looking for a SCSI host adapter,
but I cannot seem to find any stores which sell any hardware for
Atari ST. They are all very PC minded overhere.

I live in Rijswijk (ZH), so if there are any dutch guys (or girls)
out there who know something, please let me know.

Greetings, Peter

From: Victory@panix.com
Message-ID: <Victory.1134673763C@198.7.0.1>
Source record: 177458

Looking to by this monitor.....I'd prefer the made in Japan model....with the "sloped" top/back casing, etc. Will consider purchasing the korea/tawain made models too....as long as the dials are in the front, bottom below screen...etc.

Willing to pay $100 + shipping for a monitor in good condition (operationally), no burned out pixels, etc. Cosmetic apprearance is not a concern...

Thanks!

Vic.

Mac-format TT fonts can be converted to PC-format TT fonts; I think
the only difference is that the Mac file forks are restructured to fit
in a single file.

2494. Obsession Bugs

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 09:51:57 UTC
From: se2ap@dmu.ac.uk
Message-ID: <1994Nov8.095157.10960@dmu.ac.uk>
Source record: 177547

There are a few slight bugs in Obsession. Sometimes one of the flippers gets stuck in the 'up' position. This is probably due to some error in the keyboard interupt that fails to register that you've let go of the key (I've had similiar problems with the Atari keyboard processor).

Also when the ball is waiting on the spring it is wobbling up and down, plus you can't keep bouncing the ball on the spring to build up height (like you can on pinball dreams).

Apart from these minor problems the demo version looks, sounds and plays absoloutly briliantly. What do other readers think? I for one will be buying the Falcon version when it comes out, and I don't even like games (except Obsession of course!!!!) The programmers deserve our support.

Alan.

Current (ie recent lines) are the Jaguar Console :- a 64 bit
games machine.

And the Falcon F030 personal computer.

However you can also buy (very rarely) TT's - 32MHZ 68030 + TOS 3.

Yes there is. There are something like 6 Atari specific CD-Roms out
there, from which, IMHO, the Mega Archive CD is the best. Currently at
Volume 1, vol2 will be out sometime within the next couple of months.

This disk contains nearly all the files from atari.archive, and some
from hensa.

Get it, and you won't regret it. A new run is being printed atm, due to
the original lot being sold out.

>somebody knows where or how to get one please write....

When you buy Cubase you'll get two manual books with it (3 with Cubase
Score). If you've bought a second hand Cubase without manuals, your
ony hope is to contacts nearest Steinberg distributor and try to
buy the manuals from there (I doubt if they'd sell them separately).

If you use a cracked version ---- well, I'll say it if Finnish language
(so there willbe no blushing among readers): Olet kylla aika paska jatka
jos kaytat krakattya versiota, ja olisi jo aika ostaa "oikea" kopio!
Vittuako kinuat sita manuaalia ilmaiseksi! Kylla tekijoille pitaa maksaa
heidan tekemastaan tyosta.

Please, no comments from readers from Finland :-) US ASCII is not suitable
for finnish language...

In the UK Sytems Solutions (aka Atari Workshop) sell Freekeys(?). This is a circuit board that
takes that provides remote mouse ports and keyboard port including an IBM keyboard socket.
It is advertised for use with the Desktopper kit for separating the keyboard from the main unit
to give a Mega style setup.

Usually, you just need to change one byte in the bootsector
(the "media byte"). You can do this with just about any disk editor
for the ST.

From: selick@acs4.bu.edu
Message-ID: <39o0eb$mqt@news.bu.edu>
Source record: 177457

Here's a short excerpt from a listing in the /Newitems dir in a.a.umich.edu.

7. crazy7.zoo 94-10-32 43K <PC Bin>
8. dcstuffr.arc 69-12-32 1K <PC Bin>

I have 2 questions regarding these:

1) What were YOU doing on the 32nd of October, 1994? And related to that, I didn't know that DC was around in '69!

2) It appears that many programs are showing up in the archive as only 1k, when they should be considerably longer.

Far be it for me to gripe about a free service! I just wanted to bring these to someone's attention should they wish to look into it.

By the way, I used Gopher, not FTP.

Source record: 177418

I have for sale an unregistered Spectre GCR v3 complete with a Quantum 160Mb SCSI Hard Drive partioned as 20Mb for the ST & 140Mb for the Mac. I only want £300 (UK) for both items.

I also have an STe installed in a Desktopper (PC type base unit) complete with a discrete keyboard, ADSCI interface, HD PSU & another Quantum 160Mb drive partioned as C, D, E & F. For this I would like £250 (UK).

All items work perfectly.

IM>I'm curious to know how ST owners would rate them against other ST word
IM>processors out there. What are the pros and cons of each?

I haven't seen MS Word for the ST (although someone was advertising a
new shrink-wrapped copy for around $15 on FidoNet), but Word Pervert is
old, primitive code that does not make full use of the ST's
capabilities. First Word or almost any of the other ST-only word
processors beats the sox off of it.

Why not just format a new disk to MS-DOS format (you can use Fastcopy or variousPD utilities to do this), and copy the files onto the new disk?

You'll actually only need one new disk, as you can reformat the old ones to MS-DOS format once you've copied the files, then copy them back again...

IE>At work I use a MAC (Centris 650) with which I am able to access the
IE>internet. My problem is the following, how do I download
IE>shareware/freeware for the ATARI with my MAC and how do I convert between
IE>the two disc formats so that I can use the software at home.

Ed, if the Mac C650 can use MS-DOS formatted disks, you have your
solution - just use preformatted 720k floppies and transfer the files
using 8.3 filenames. The ST uses the same file system as MS-DOS and can
read and write the disks directly. However, the formatting program in
the ST's ROM will not write the MS-DOS header on the disks, so you'll
need to either buy the disks preformatted (which is how most of them
come these days, here in the US, anyway), or get a formatter program for
the ST that writes the MS-DOS header.

Good luck!

IS>more reliable? It runs as the first thing in the auto folder. I
IS>also have Pinhead 2.1 and Headstart 1.1 installed.

IS>Any other fixes necessary (I have FOLDRxxx installed)?

FATspeed MUST be the first program in the AUTO folder. Anything that
runs before FATspeed will cause problems.

Also, you will want TurboCTS if you ever use a comms program with the
MST2.

My son has the British version of the same machine here, and we run
FATspeed quite happily.

Source record: 177469

-- Shurely shome confushion here...

You can use SCSI commands to control a CD-ROM playing an audio CD, thereby making your ST/Falcon into an overpriced remote control unit. You can also plug the output of any piece of audio equipment into the microphone jack socket of the Falcon, but to avoid grief you should either wire a suitable resistance (mumble) in series or turn the volume way down low.

But the really cool thing to do is to grab the digital information directly from the CD, without going via analogue. This is possible given the right driver software and the right CD-ROM drive: it works with Hard&Soft's CD Tools and my CD-ROM drive. I can't hear what's being recorded and it seems to take about 50% longer to transfer the data than it would to just play the CD. The result is a 44.1 KHz 16-bit stereo .WAV or .AVR file, which I can't play %{. I plan to use sox to convert it to a mono 22KHz Apple sound file... maybe tonight, who knows.

>I was wondering if there's a way of getting a postscript-file out of calamus instead of printing to a printer..
>I would like to use my schools HP laserjet 4P (600dpi) instead of my old 9pin Epson.

No. Sorry. However, if you can get hold of a Calamus - LaserJet printer driver which uses the TOS printing routines (ie is "legal") rather than the one supplied, it is possible to redirect output to file. The FaST club claim that they have a driver which, when used with Multiprint, allows you to do this. I tried writing my own then gave up and borrowed a LJ instead but it is technically feasable.
Cheers

Sorry. I should have added that this will not be a PostScript file - Calamus cannot output PostScript due to it's design limitations - the .CFN format is completely (well, fairly) unlike Type 1 PS. It will also be *very* big if it's a long document.

/j

Hi,

I'm using a Mighty Sonic in my Falcon since one year. The speed is about two
times faster as a normal Falcon if you use Fast-RAM.
There are no compatibility problems I think. You can decide if you want to
work with 16 or 32MHz.

Tschau,

On Saturday November 5th at about five past eight
raver909@telerama.lm.com (*Joe LeSesne*) happened to write:

JL>called Gasteiner in London, UK is selling 1040STE's with 12 Megs? Yes

They selll boards for several Atari-machines to fit a max. of 8 megs. Has
anyone successfully installed such a thingy?

I have my doubts ...

2533. Q: how to upgrade 520ST...?

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 18:44:26 UTC
From: gt5616a@prism.gatech.edu
Message-ID: <39ogua$ott@acmey.gatech.edu>
Source record: 177481

Here are a bunch of questions from a new Atari user. (I'm a Mac user usually, but there's a certain piece of software I want to run on the Atari (EditTrack).)

Questions about upgrading a 520ST

I have a 520ST. I'd like to run EditTrack on it, but EditTrack requires 1 Mb RAM. I don't have the ST here, so I can't see how much memory it has, but chances are that it has 512K. In that case, I'll have several possible choices:

a) Upgrade the 520ST. I'm not sure how to do this. I have a Mac Classic II with 4 Mb of RAM, which I'd be happy to steal RAM from if the 520ST can accept Mac SIMMs. (My fear is that it's either too old for SIMMs or that it just won't take Mac SIMMs.) I've been told that you have to add some kind of special memory adapter to take the 520 past 512K. I've also been told that it's cheaper to buy a used 1040ST than it is to upgrade a 520. If I can use my Mac's SIMMs, though, I think it might be worth it, depending on what's involved in upgrading the old thing.

b) Get a used 1040ST. This would be OK, but it would probably be more expensive than upgrading the 520ST, especially if I can use my Mac's SIMMs. Otherwise, I guess the cost of the SIMMs alone might make it a better option. But another problem is that I don't have an Atari monitor. I do have a composite monitor, and I can hook the 520ST to it, but I don't know if the 1040ST has a composite video output. If it doesn't, I'd have to buy a monitor, and then I'd be looking at some real money <grin>. And, of course, finding a 1040ST might be somewhat difficult, if my recent efforts are any indication.

Questions about disk drives

I also need to get a new disk drive for the 520. The one I've got is external, and quite beyond repair. Questions here: Can I get an internal drive and put it in the external's box? Can I put an internal drive in the 520ST (remember, it's been a while since I saw this thing)? What kind of disks does the Atari use (e.g., Mac, IBM, proprietary)? I've heard that there are single and double-sided Atari drives- can I get away with a single-sided, or should I get double-sided?

Well, if anybody has some useful (or useless) insight on my situation, feel free to shed light. (Also, if anybody has an old version of EditTrack that runs in 512K of memory that they can sell cheap... that would be great.)

- Michael Ashton
data@havoc.gtf.gatech.edu

2534. Re: Mint, Minix? (why/what??)

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 19:24:08 UTC
From: michrm@central.susx.ac.uk
Message-ID: <39oj8o$d40@infa.central.susx.ac.uk>
Source record: 177483

Hallvard Tanger&#65533;s (hallvart@ifi.uio.no) wrote:
: Can someone please explain to me exactly what the use of Minix and
: Mint is. Why do people install it on their STs, does it make the
: machine "better" in some ways, can it do things GEM can't?
: Do I need it?

: Hallvard

MiNT is a multitasking system (kernel I think is the right word) for the Atari range of computers. It was adopted by Atari a while back but started off as a PD project by Eric Smith (now working for Atari...?). It can work on its own or with the MultiTOS system which Atari have released.

The MiNT kernel can be ftp from many sites, but later versions must be compiled by the user...they are usually beta versions which cannot be expected to be totally realiable => they may well have bugs. It is thought that those who can compile it, usually have some know how and can report/fix bugs.

MiNT can load other file systems such as the Minix file system which allows faster access, and longer filenames amongst other things. You must have MiNT to use the Minix FS.

People install MiNT/MultiTOS/Minix for a number of reasons. Multitasking begin the obvios one for MiNT and MultiTOS. Minix is just a nicer file system for the reasons already mentioned.

Please don;t flame me for mistakes...just correct em politely ;) Hope that helps a little. MiNT has alot of other neat features, like pipes, but it would take too long to go through the lot.

There are other Multitasking systems around which ahave their advantages and disadvatages, such as MagiX, Geneva and OMeN.

Michael

2535. WILL BUY these unwanted softwares

Newsgroup: comp.sys.atari.st
Date: 1994-11-08 19:32:34 UTC
From: kowalski@futureworld.digex.net
Message-ID: <1994Nov8.173633.18162@nntpxfer.psi.com>
Source record: 177474
Cross-posted to: comp.sys.ti,comp.sys.tandy,comp.sys.ibm.pc.games,comp.sys.cbm,comp.sys.att,comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.apple2,alt.games.video.classic

I am in search to BUY these programs from whatever computer you may have
them for:

Software Name Software Publisher
---

1) "Pinball Construction Set" - Electronic Arts or Budge Co.

2) "Graphics Magician" - PolarWare or Peguin Software

3) "Special Effects" - Peguin Software
- painting and drawing software
for Apple II computers

If you have any of these, I will take them off your hands for a respectable
price. Please don't respond here, but instead send e-mail to:

kowalski@futureworld.digex.net

Thanks!
Rob

>>>>>>>>>>>>>>>>>>> Nick's Game Ratings Instructions <<<<<<<<<<<<<<<<<<<
================================================================================
Date : 11/01/94 Version : 1.25
================================================================================

Are you tired of spending 60$ for a cartridge, getting it home, and
finding it would be best used propping up the coffee table? Is 4 hours of
fun not exactly what you had in mind when you layed out those big bucks?
Here is a list of ratings, from people like you who voted their mind
about how good or bad their cartridges are. Make your friends vote also,
that way we're going to have more views.

Nick's Game Ratings
-------------------

The Nick's Game Ratings are a compilation of the votes that I receive
for the games on the Sega Genesis, Sega CD, Gamegear, Super Nintendo,
Nintendo, GameBoy, Atari Jaguar, Atari Lynx, Atari ST, CD32 and 3DO systems.
It's what the players think of the games.

HOW TO VOTE
===========

You can contribute in a number of ways to the database:

* vote for games you have played
* change or add information on a game already in the database
* add a game that is not yet in the database

If you'd like to correct a mistake in a game entry or simply add the
value for one of the missing fields, send me a mail in the format
described below.

ACCEPTABLE COMMANDS
-------------------

%GENVOT <vote> -> <Name_of_Game>

This command is to place a vote for the Sega Genesis game
called <Name_of_Game>. _Note_ that <vote> must be between 1 and
5 for your vote to count, where 1 means dire and 5 means
excellent. If <vote> is 9, your vote will not be counted _but_
this will enable you to modify the database afterwards. To vote
for games other than for the Genesis, replace %GENVOT with one
of the following:

+ %SCDVOT, for Sega CD
+ %GMGVOT, for Game Gear
```

+ %NESVOT, for Super Nintendo (SNES)
+ %NINVOT, for Nintendo (NES)
+ %GBYVOT, for Game Boy
+ %C32VOT, for Amiga CD32
+ %JAGVOT, for Atari Jaguar
+ %ALXVOT, for Atari Lynx
+ %3DOVOT, for 3DO
+ %ASTVOT, for Atari ST

%GENADD <vote> -> <Name_of_Game>

This command is to place a vote for a Sega Genesis game not already in the list called <Name_of_Game>. If <vote> is 9, your vote will not be counted BUT this will enable you to add that game and modify the database afterwards. Again, for other platforms substitute %GENADD with one of the following:

+ %SCDADD, for Sega CD
+ %GMGADD, for Game Gear
+ %NESADD, for Super Nintendo (SNES)
+ %NINADD, for Nintendo (NES)
+ %GBYADD, for Game Boy
+ %C32ADD, for Amiga CD32
+ %JAGADD, for Atari Jaguar
+ %ALXADD, for Atari Lynx
+ %3DOADD, for 3DO
+ %ASTADD, for Atari ST

The next functions can ONLY be used after a VOT or an ADD :

%DESC <description_of_Game>

This command will enable you to put a description (see the GAME DESCRIPTION section) for the game previously rated.

%YEAR <Year_of_Release>

This command will enable you to add the year of release to the database for the game previously rated.

%COMP <company>

This command will enable you to add the company to the database for the game previously rated.

%PLAY <Number_of_Players>

This command will enable you to add the number of players playing simultaneously to the database for the game previously rated.

SOME EXAMPLES

To vote for Super Mario Kart for the SNES:

%NESVOT 4 -> Super Mario Kart

To vote for Sonic 2 and Sonic 3 for the Genesis, and add the extra
information about Sonic 3 that it was released in 1994:

%GENVOT 4 -> Sonic 2
%GENVOT 5 -> Sonic 3
%YEAR 1994

To vote for Zool (AGA) on the Amiga CD32, and add the fact that it is
a 1-player game released in 1994, and also the fact that it
should take 20 hours of gameplay to complete, plus add Zool for
the Genesis, vote for that too _and_ say it's a platform game
on the Genesis (!):

%C32VOT 3 -> Zool (AGA)
%PLAY 1
%YEAR 1994
%HOURS 20
%GENADD 4 -> Zool
%DESC Platform

THE VOTES
=========

* - Dreck, yak, bleck, hack, gleck (Horrible beyond words).
** - OK, playable, still dreck, although someone might like.
*** - Decent game that will appeal to some (But not everyone).
**** - Pretty good, a fun game that almost everyone will like.
***** - Damn good, a real winner, every game should be this good.

GAME DESCRIPTIONS
=================

Adventure - Games where you must explore large worlds, killing enemies
and discovering hidden treasures, sometimes with a quest.
Arcade - Games that fit in no specific category except that they
are easy to start playing and are like arcade games.
Copter Sim. - Games where you are controlling the flight and other
capabilities of a helicopter, from a cockpit view.
Driving - Games where driving is the main object of the game, but not
racing other vehicles. Also may include combat & variations.
Easy R.P.G. - Games that are role-playing games but are designed for
the novice player to easily begin play. See Role-Play.
Fight & Jump - Games where you fight and jump to stay alive, and sometimes
have other powers. Boards usually scrolling horizontally.
Fighting - Games where you face off against another player, or the
computer in some form of one-on-one combat.
Flight Sim. - Games where you are given a cockpit view of some sort of
aircraft, and are given a flying mission.
Game/Show - Games that either emulate game-shows or board games.
Competition is with other players or against the computer.
Light-Gun - Games where you must use your system's light gun to perform
some function, usually similar to Shooter-type games.

Interactive - Games where you interact with on-screen video characters
in order to complete the given scenario.
Maze Game - Games where navigating a maze is the main objective. This
can be from any perspective, such as above and inside.
Multiple - Games where there are a variety of game scenarios of
differing sorts, played either randomly or in sequence.
Pinball - Games that emulate the playing of arcade-style pinball
machines, usually with some different options though.
Platform - Games where moving from platform to platform, avoiding
enemies, and getting prizes are the objective.
Racing - Games where the objective is to beat an opponent (either
computer or human) in some sort of vehicule race.
Reality Sim. - Games of this type take place from the point of view of a
fictional character's perspective. Like virtual reality.
Role-Play - Games where you take on the role of some sort of adventurer,
able to increase in abilities and experience along the way.
Shooter - Games where you shoot a lot and avoid being shot by the
enemies you are shooting. Most often are space scenarios.
Sports^ - Games where there is some sort of sporting event to play
other than everyday, normal sporting events.
Strategy - Games that require more thought than dexterity. This can
encompass a great variety of different type games.
Sub Sim. - Games where you are given the command and control of a
submarine and play from a viewpoint within the sub. itself.

Tank Sim. - Games where you are given the command and control of a
tank and play from a viewpoint within the tank itself.
Think-Fast - Games that require the player to make fast decisions and
act on them, kind of a quick-thinking strategy.
Very Young - Games that are too easy for adults and even kids, these
games are really meant for kids 5 and under.

^ Regular sports games will be described by their appropriate sporting event

HOW IS COMPILED THE TOP SECTION
==========

At the begining of the lists, the minimum number of votes
needed in order to qualify for the TOP SECTION was of
four. With the time, I got more votes and some people pointed out
that four voters for a game is not that much so we came up with
a change.

From now on, the minimum number of voters to qualify will be
calculated from the number of voters.

The formula is : Average number of voters per game

STD

2

Note : The minimum number of votes required to qualify is 10.

GETTING THE RATINGS
==========

By E-Mail :

The latest release of my ratings are one e-mail away. All you
have to do is send me an e-mail (paien00@dmi.usherb.ca) with one of
those commands as the SUBJECT :

get_sega - Ratings and Voting Ballot for the Genesis
get_segacd - Ratings and Voting Ballot for the Genesis CD
get_gamegear - Ratings and Voting Ballot for the GameGear
get_supernes - Ratings and Voting Ballot for the Super Nintendo
get_nintendo - Ratings and Voting Ballot for the Nintendo
get_gameboy - Ratings and Voting Ballot for the GameBoy
get_jaguar - Ratings and Voting Ballot for the Jaguar
get_lynx - Ratings and Voting Ballot for the Atari Lynx
get_cd32 - Ratings and Voting Ballot for the CD32
get_3do - Ratings and Voting Ballot for the 3DO

NOTE : DO NOT put any ratings in those messages because I don't read
them, my mail filter is doing all the job. Also be sure of
including the underscore.

Over The World-Wide-Web :

If you have access to the World-Wide-Web (WWW) with any of the following
browsers:

o NCSA Mosaic - for Unix/X systems
o Mosaic for Windows - for PCs with Windows
o MacMosaic - for Apple Macs
o AmigaMosaic - for Commodore Amigas
o Lynx - vt100 Unix (or similar)

The address (or URL) of Cardiff's Video Game database browser is:

http://www.cm.cf.ac.uk:/Games/

Come and have a browse, and enjoy!

Sy: maintainer of Cardiff's Video Game database browser.
e-mail: Simon.N.Smith@cm.cf.ac.uk

On FTP Site :
---
ftp.digex.net
under /pub/access/spatton/
SunSITE.Unc.EDU
under /pub/micro/games/sega/ratings/

Please vote for ALL the games you have played, not just the ones you liked. People want to know which ones are really crappy. Also if you have a suggestion or a comment about the ratings, send it to me - as you can see I've been more than willing to make changes - but I make no promises that everyone's ideas and changes will be made. I apologize to anyone who's votes I lose or mess up. WARNING - you might find mistakes. You will not hurt my feelings if you write me to bring any mistake that I made to my attention. I do not read the newsgroup all the time so it's safer to send me e-mails than to reply to the message.

And for those of you who participated -
Thank You

Nick

Hi,
Merlin here.

We are distributing the game in the UK along with jcaeurope. We are pleased that you liked the game. We have just passed on your comments to the programmers and they
appreciate your feedback. The Falcon version should be out in March 1995.

Hope to hear from you soon :)

> By the way, I used Gopher, not FTP.

That is pretty weird. I just looked at the gopher listing for the first time, and I must admit that it does give some bizzare information. First, let me assure you that the files are in fact fine. Here is an ls -l of those two files from the /Newitems:

baldrick 25 Nov 2 09:19 crazy7.zoo -> ../Games/Cards/crazy7.zoo
baldrick 28 Nov 5 11:43 dcstuffr.arc -> ../Utiliites/Dc/dcstuffr.arc

(I cut off some info in the front so it would fit) Now, note that the files actually reside in the directories mentioned at the end. The Newitems directory only has links to these files (the links go away after a couple of weeks). That might be part of the problem in terms of how gopher displays stuff, though it does not seem to be a fully determinite part. In fact, if we look at where the file actually resided with gopher, we see:

47. dcstuffr.arc 94-11-06 12K <PC Bin>

Which is obviously much more accurate. Also, with my gopher client, when I try to retrieve the dcstuffr.arc file from /Newitems, I get a zero length file. However, when I retrieve it from its "real" directory, I get the actual file.

So, the moral of the story seems to be: Use ftp if you can. If you cannot, get the weekly "newstuff" listings that we post to this newsgroup, and get the files (via gopher) from the place that they really reside in, not from the /Newstuff directory (which is only links). There might be

other solutions, I have only worked on this for a couple of minutes.

I have a funny feeling that this problem has to do with three things:
Gopher, the link structure in /Newitems, and the use of AFS at umich (this
is a wide-area distributed filesystem thing).

~ The Independant Magazine for users of the Calamus DTP Package ~

If you are a user of the Calamus DTP package you will undoubtedly be
Interested to learn of the arrival of an Independant Magazine totally
dedicated to this "Great Professional" Desktop Publishing Program.

This Magazine Is available on a quarterly basis, in an A4 mono format
with a minimum of 14 pages per issue.
The aim of this magazine is to help you, the user to gain the most
from your investment. CALAMUS USER will act as a platform for users to
help to offer others and exchange ideas. Whilst keeping you informed of
the latest events in the Calamus and DTP world.

News Desk will contain the most relavent and up to date information on
product announcements within the DTP world to keep you abreast of this
fast moving market.
Each issue has an indepth reveiw on a forthcoming, new or existing
product that will enhance the use of Calamus. Many reviews will be written
by experienced users who rely on the best products for there livelihood.
Technical tips will tell you what the manuals don't. This willbe done by
experienced users and you will learn all there is to know about Calamus
DTP.

The CALAMUS USER is available now four times (quarterly) a year for the
introductory price of $22.00 (US Dollars) postage paid to your address.

This "Fanzine" will only survive if you the user contribute to it's
content. So, please help us to achieve our goal by subscribing to it.

For more information about this magazine, or if you want a years
subscription please send checks (US currency only) made payable to:

D. Trutzenbach
31 Muskingum Drive,

Shamong, NJ 08088.

or call the Round Table BBS at (609)268-7524, your Calamus, Desktop Publishing support BBS.

~ Remember The Windows NT version of Calamus will be availabe soon ~

>using 8.3 filenames.

All later Mac's with the 1.44Mb 'superfloppy' drive can read and write DOS (or Atari) formatted diskettes, however the process can be made easier with a bit of software such as Apple's PC File Exchange or Insignia Software's Access PC. The latter allows you to format DOS disks on the Mac and even auto converts lengthy Mac filenames to the more conventional (although less useful) 8.3 format.

>Mac File Exchange to translate atari files properly?

I'm not that familiar with Mac File Exchange (I use Access PC, instead) but
quite often the trouble you describe is due to the telecom program settings
used on the Mac to download Atari files. Make sure when downloading any
non-Mac file that the 'MacBinary' option is turned OFF. This should result
in a clean download of a plain text file.

> >works.
>
> Well, why not connect this speed upgrade to the main processor too ??

At least one good reason is that the CPU don't have a clock speed strap,
so I would have to cut into the PCB. Another reason is that I realy don't
know what would hapen to the bus timing when the CPU is doing synchronous
bus-accesses... I guess there's som reason why a product like CaTTamaran
tok so long to appear.....

> If a stock 16 MHz Falcon can handle 40 MHz, how far could a 32 MHz 68030
> go...

It's not the Falcon, but the CPU that handles 40Mhz. The rest of the
machine stays (more or less) at the good ol' 16Mhz!
And most 16Mhz marked CPU's are probably 32Mhz parts 'relabled', so a
part marked 32 MHZ would probably not go any further than a 16MHZ part!
At least this is what I've heard is valid for Motorola CPU's and
FPU's. And the Falcon 32MHZ upgrades sort of verifies this story.

Maybe my 32Mhz FPU realy is a 50MHZ part in disguize:)

I have a problem with the SF314 double drive. It will not read any of my disks. When I try to create a folder with that disk drive it tells me that "the application cannot find the folder/file you tried to open." It reads all disks as having 0 bytes and 0 items. The drive is 6 years old. Does that mean I need a new drive? Can anyone help me with this? Which ocmponent in the drive might be damaged?

Please e-mail me or post back to the newsgroup some suggested actions.

All help is appreciated. Thanks in advance.

From: hallvart@ifi.uio.no
Message-ID: <39p2nv$i2@holmenkollen.ifi.uio.no>
Source record: 177264

I have downloaded Upoint light several times and tried to make it
work, but I never get any GEM screen or anything!

I remember I tried out this program last year, and I got it working,
but I can't remember where I downloaded it from.
Can someone please help me.
Are there other offline readers?
I also got hold of "Microtalk QWK offline reader" "MT_QWK.PRG"
and this seems to work okay, but what is the difference between UUCP
and QWK? Two different standards, or totally different things?

Hallvard

2561. GEnie changes

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 00:15:37 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9411082321.AA00366@ilmen.lanl.gov>
Source record: 177265
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

There have been some rumors floating around about GEnie dropping support for the Atari in the near future. I went to the head of the class, so to speak, to find out what the real story was. Here is the reply I received from Darlah Potechin, Chief Sysop of the Atari RT on GEnie:

From darlah@genie.geis.com Mon Nov 7 20:21:33 1994
>
> Although it is true that there will be a GUI for the Mac and IBM,
> that will not let the Atari market out. At the worse case
> scenario, we would have text. Though, a GUI for Atari is in the
> market to happen. Rest assured, Atari support on GEnie will
> continue.
>
> Thanks!!

So with evident pressure from the likes of AOL, it looks like GEnie is going to go graphical, too. Let's hope that whatever GUI tools they cook up for the Atari will be as good as their ST Aladdin software.

-Hutch- @ Fair Dinkum Tech

P.S.: I apologize for the crossposting but I thought this was important enough to justify it.

2562. Re: SpeedoGDOS 5.2

Message-ID: <39p766$1m6@ixnews1.ix.netcom.com>
Source record: 177488

1. No matter how you picked up SpeedoGDOS 4 (ie - purchased outright, included with Falcon/Works, etc.) you can upgrade to
SpeedoGDOS 5 for $50 (in the US). Contact COMPO Software - 415-355-0862 (US), 0487-3582 (UK).

2. For US and Canadian registered users, the upgrade from version 5.0b to 5.0c is free if you want the upgrade emailed to you.
Just send a request in email - send it to compo@genie.geis.com. The upgrade can also be ordered on diskette for $10. UK users should
contact COMPO Software Ltd. at 0487-3582.

3. As Chris pointed out, SpeedoGDOS 5 can use Type 1 and TrueType fonts from a Mac, but they must be converted to PC format
first. This is very easy and straightforward, and there are numerous utilities to convert font format.

Robert Engberson, COMPO Software

Well, I have played the Falcon version (I was trying to decide
whether to buy Ishar III - F030 or Robinson's), and although a 32 mHz
machine would be nice anyway, it didn't really need it. BTW, the
reason I didn't buy it is that I'm waffling between buying it for the
Falcon or the Jag, and I want to see the Jag version before I make my
judgement.

From: damms002@acpub.duke.edu
Message-ID: <39pepj$hbt@news.duke.edu>
Source record: 177491

To my knowledge, NVDI 3.0 as well as SpeedoGDOS 5.0 support all kinds of vector fonts but NVDI 3.0 is able to use these fonts even without SpeedoGDOS.

Is theire any advantage using NVDI 3,0 and SpeedoGDOS 5.0 together or is it enogh to use NVDI 3.0 alone ?

Is an upgrade from NVDI 2.5 to 3.0 available ?

Dose the current NVDI ET 400 also support Speedo fonts ?

I'm looking for An Inexpensive, Complete Copy of Frontier Elite II as a Present for a Friend. I'm also looking for an Inexpensive, Complete copy of Flash II. REMEMBER, I'm looking for Flash II, not Flash 1.6 from Antic. Does anybody know if Flash II supports Z-Modem as easily as X and Y-Modem? I hope its built in? I'm also looking for an ICD ADSCSI+ Host Adapter. It should say so on the Edge of the Host Adapter. Also, I'm looking for an inexpensive and complete copy of the OCR SoftWare from Migraph. I don't mean the Lite Version, I mean the complete version which will accept Scans Scanned from the outside of OCR From Migraph.

All interested Parties Reply in E-Mail:

bensmith@teleport.com

I also want to give my compliments to the programmers of OBSESSION. It`s a very cool game indeed (I`ve tried the demo-version). I just wish that the Falcon-version could be out a bit earlier, since I have a Falcon, and wan`t to buy OBSESSION.

Keep on going strong :-)

I have played ROBINSON`s REQUIEM on a 16 Mhz Falcon and the graphics looks very (if not identical) like the PC-version, the sound is a little better on the Falcon.
BUT it`s true that a 32 Mhz or better Falcon would be better to play the game, it`s quite heavy graphics.
I have a 36 Mhz Falcon myself :-)

>system for the reasons already mentioned.

Minix is a complete new operating system, more or less compatible with
Unix 7. It supports multitasking, multiuser, all the things you would a
Unix system to support. All the sources come with the package, and it is
rather easy to compile it yourself (if you make changes, the binaries are
also delivered with the packege). Only it is NOT PD, but copyrighted by
P. Hall. I heard some rumours about Minix 2.0 which would be completely
posix complient.
There are a lot of Utils/tools/upgrades on the net, and even a newsgroup`
comp.os.minix.

Words from IMAGINA company and democodergroup

My fried has been developing an STE shoot'em up game a year now and
The work is near its end. The reason it took so long is the lack of
a productive graphist. Now he got hold of two very good artists and
the work has taken off.
He is planning to make a twoplayer beatemup (like IK,MK,SFII) in TRUEcolor.
The graphics are being drawn by the best sci/fantasy artist in Norway and
are unbelivable. The frames will be scanned in from airbrushpaintings.

I just wondered how big a market it is for STE and FALCON games out there.
After I saw fuzz about Obsession I suspect that there is a market for a
GOOD game for the STE. The shootemup he is making is PERPLEXED and is
an 1 meg STE game. It uses the blitter and will run with 12.5 khz
module+samples and run on 25fps. IMAGINA is also releasing the ESION sound
tracker any day NOW. Tis will be the only FULLY WORKING VERSION of ESION on
the market and will be a commercial program. He is also planning to convert
the program to falcon 030 and expant to 16 channels instead of 4.

What I'm intersted in is how many of you are interested, and how many
will buy these programs. For those of you living in the US we will be
selling games over mail(post).

Reply to my e-mail adress

No info on which machine, bad. But your very well and best software,
does it run on other ports than the MODEM1? Will your software run
on other ports than the "atari-original" ones (on machines, which
does not have the "normal" serial hardware)? The answer at least
for the second question will be: "No."

And the most interesting thing: You did not send any mail to me.

There is at the moment only one clear standard for controlling
the serial ports of Ataris, and this standard is supported by the
HSMODA-driver package.

Yes, this standard came late, and it not "atari-official", because
Atari decided to work only for video games in the future, but Atari
is not honestly enough to say it directly.

Regards, HS

2583. Questions about Flash 2?? Please Help...

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 12:51:35 UTC

Does Flash 2 support VT100\ANSI as well as the Old Flash from Antic Did?? I use Flash 1.60 because it supports VT100 Better than FZDT and it works better for me on the InterNet. Unfortunately, I also now need to use Z-Modem but Z-Modem isn't built in to Flash 1.60. Is Z-Modem built into Flash 2 like X-Modem and Y-Modem Batch was in Flash 1.60?

Also, does anyone have an inexpensive, complete copy of Flash 2 for sale?
Also, does anyone know what is the current version of Flash 2?
Also, does anyone know the Quality of Flash 2's Manual? And how big of a Manual is it and how many pages?

Please direct all replies to E-Mail:

Hi Billy,

-> For only $100, it seems like it cant be beat. Ive downloaded the demo
-> software, and went thru the 'run me first' installation
-> tutor, and it looks pretty simple. It states that installation in a
-> Rev G system is easiest, but I dont have a Rev G. The demo didnt
-> mention anything less than this, altho I would hope that the
-> install instructions would cover such things (dunno what rev my
-> system is) I am not afraid of a soldering iron, but am afraid of
-> screwing things up.

If you need any info regarding the CaTTamaran, please write to:

cyrel@cybercube.com (is being set up right now, so you might also
want to try: cyrel@interlog.com)

To identify your motherboard, check these 'vital parts':

1. Is the CPU on the left or right hand side of your motherboard?
If it is on the right hand side, you got at least Rev.F or higher.

2. If it is on the left hand side, is it on a CPU daughterboard
(those are the motherboards we refer to as Rev.A) or in a
socket (that's what we call Rev. B)?

There are three set of instructions, one for Rev.A, one for Rev.B-E
and one for Rev.F and higher.

If you do not feel comfortable soldering and you have an <Rev.F board,
ask a dealer or a technician to install it for you.

Ralf.

NVDI 3.01 supports Speedo and TrueType. I can't say how well as I don't have a copy.

Speedo 5.0c supports Speedo and TrueType and PSType1. The last two formats show scrambled
encodings in the high 128 slots especially with Symbol and ZapfDingbats, also the encoding
changes
depending on how complete the font is. Even the Speedo format shows some faults, at least
with
the copies of Symbol Mono and More Wingbats I received with 5.0beta.

2594. Re: CaTTamaran

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 14:19:00 UTC
From: ralf.doewich@canrem.com
Message-ID: <60.54765.4514.0N1BD930@canrem.com>
Source record: 177365

Hi Christoph,

-> How much you can benefit from the board depends a lot on which
-> application you run. As only the CPU is accelerated and as there
-> isn't any additional cache memory included in the CaTTamaran, memory
-> intensive applications (e.g. TeX or GemView) hardly benefit from the
-> accelerator (only 10-15% performance increase).

To get a higher performance index, use TT-FastRAM whenever possible.
Also, install something that relocates the ROM to the FastRAM. This can
boost your ROM accesses dramatically.

-> It looks quite differently when it comes to programs like POVray
-> whose performance depends a lot on the pure CPU speed. CPU intensive
-> applications are accelerated up to about 30%.

That's true. Your performance increase vary from application to
application. You will get the biggest increase where you have to deal
with heavy CPU activity.

-> I think you will hardly find an application which will run 1.5 times
-> faster, although this would be the theoretical speed up (48 MHz vs.
-> 32 MHz). Every program needs more or less memory to run. And for
-> every memory access, the CaTTamaran has to _wait_.

Not quite. The CaTT improves regular memory access (ST-RAM) to the level
of TT-FastRAM. So, even without a FastRAM card, you can have quite a
boost. When it comes to FastRAM cards, disable BURST mode whenever
possible. At 48 MHz the CaTT/CPU handles regular accesses faster than
most boards to BURST cycles, thus we found that we were able to increase
our TT-FastRAM access index from 179% (regular GE-Soft board) to 220%
(modified). Check the documentation.

-> In general, every clean GEM program won't have any difficulties when
-> run with the CaTTamaran. For critical applications, it is possible to
-> switch back to 32 MHz, which guarantees 100% compatibility with a
-> plain TT.

It's easy enough using the Dashboard. *grin*

Ralf.

>Mac File Exchange to translate atari files properly?

>Thanks,

>Brian

Get DOS Mounter ;) No, I can't remember the exact details as
it's been awhile since I've used Mac File Exchange, but the menu you want
to look under is 'Mac to PC'. Under that will be a few selections one of
which is 'default'. Check and see which one is turned on if it's default
and still giving you problems, I believe there is an item at the bottom
of the list that is 'select default' or 'configure default' or something
along those lines.

Hope that helps some.

Also avoid any translations if at all possible. Look for
something along the lines of 'Raw Data'.

2598. HP Deskjet questions

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 15:26:39 UTC
From: mcnaugra@vax.sbu.ac.uk
Message-ID: <1994Nov9.152640.8287@vax.sbu.ac.uk>
Source record: 177426

I've been playing with my new Deskjet 560C for a couple of weeks now, and I thought I'd better get some advice before wasting any more ink ... one of the questions I have is ST specific, and there didn't seem to be any more suitable group for the others, so here goes:

1) Pagestream drivers. The Laserjet driver will work in mono, but I'm wondering if there's a colour Deskjet driver available. I've got several collections of HP utilities, from PD libraries and FTP sites; hundreds of different drivers for 1st Word Plus, but none for PageStream. I'm using an old version (pre-V2) if that makes any difference.

2) Colour text printing. There don't seem to be any codes in the manual for using colour with the internal fonts. Is it possible?

3) Paper. Anyone know of a good compromise between plain paper and the over-priced HP Glossy stuff? Bleedproof marker paper seems to work well for CMY colour, but it doesn't like the black ink at all.

Thanks,
Ross

From: ford@esvax.dnet.dupont.com
Message-ID: <ford-0911941031410001@fordduo.es.dupont.com>
Source record: 177363

I bought this a few years back, then one day, it wouldn't boot. It won't try to access the internal drive. I've tried swapping for another floppy drive, new power supply, new glue chip, etc....

Must have a memory problem on the motherboard....

So, make me an offer and it's yours for the parts:

1040 ST , 1Mb RAM , internal floppy, mouse, 2 power supplies. I have no idea what it's worth, so make an offer. I WILL sell to best offer as of 12/1/94.
UPS COD, you pay shipping.

>vector fonts but NVDI 3.0 is able to use these fonts even without SpeedoGDOS.

NVDI support Bitstream Speedo and TrueType fonts. It has a built in font
scaler/rasterizer which makes it independent of SpeedoGDOS.

SpeedoGDOS supports the above two formats + PstScript Type1 fonts.

Both support old bitmap GDOS fonts.

>Is theire any advantage using NVDI 3,0 and SpeedoGDOS 5.0 together or is it
>enogh to use NVDI 3.0 alone ?

If you don't need the Type1 support, you could do well with NVDI only. I
believe Speedo comes with more fonts and drivers though.

>Is an upgrade from NVDI 2.5 to 3.0 available ?

Yes.

>the Falcon, the Jaguar, the Portfolio or various other products.

Oh, well excuse me for livin'.

GEnie currently maintains a specific area (called a RoundTable) for Atari
support including all the machines you mentioned, to some extent. This
support includes a staff of Sysops, some salaried and some as volunteers
with limited free access.

If they dropped support, this officially maintained area would go away.
That is not going to happen in the forseeable future, according to GEnie
sources. A graphical front end for the Atari will likely come about but
not until after the PC and Mac software is finished.

Clear enuf for ya?

IG>I also need to get a new disk drive for the 520. The one I've got is
IG>external,
IG>and quite beyond repair. Questions here: Can I get an internal drive and
IG>put it in the external's box? Can I put an internal drive in the 520ST (rem
IG>ember, it's been a while since I saw this thing)? What kind of disks does t
IG>Atari use (e.g., Mac, IBM, proprietary)? I've heard that there are single a
IG>double-sided Atari drives- can I get away with a single-sided, or should I g
IG>double-sided?

Get any double-sided 720k drive you can find for a good price. If you
have a double-sided drive in the external case now, it should just plug
& play (although you may need to perform surgery on the faceplate of the
plastic case). Don't mess with single-sided drives, they aren't worth
anything, and you can't swap disks with some systems (MS-DOS
preformatted disks, for example, are all double-sided). Also, the best
software is now on DS disks and can be a major pain to try to switch to
single sided.

If you have any problems with the hardware upgrades, drop me a line -
I've done dozens of them. Toad also does the work, and probably won't
charge you any more than anyone else.

2611. ATARI 520ST forsale very cheap

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 17:21:10 UTC
From: joe@trdlnk.com
Message-ID: <Cz0G7D.B6n@trdlnk.com>
Source record: 177207

I have an Atari 520ST that I upgraded to 1Meg of RAM. It has a floppy drive and a color monitor. I know these things are obsolete but the unit is like new and the color monitor has to be worth something.(The monitor has excellent clarity). All 3 pieces are original Atari. It also has a mouse and tons of floppies with all types of games on them.

I'll sell it to who ever makes the best offer and you don't have to offer much.

2612. Re: HSMODA04 doesn't work with Stalker 3?

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 17:32:02 UTC

Message-ID: <1938XUOHLDYMNFHAFM@pplnet.com>
Source record: 177326

IS>In article <029334UXXJGENDMFPBDU@pplnet.com>, blade01@pplnet.com writes:
IS>> Gribnif is not the problem. HSModa04 works with Semper here, and with
IS>> XYZ.TTP - but it does NOT work with FidoDoor, ST-Keep, or any of the
IS>> other software I run on-line. HSModa04 is broken. Period.

IS>No info on which machine, bad. But your very well and best software,
IS>does it run on other ports than the MODEM1? Will your software run
IS>on other ports than the "atari-original" ones (on machines, which
IS>does not have the "normal" serial hardware)? The answer at least
IS>for the second question will be: "No."

It's a Mega STe with TOS 2.05; some of the other software that will not support MODEM2 and SERIAL2 was written in GFA BASIC (which is crap, of course) and I am currently translating the sources I have to HiSoft BASIC 2 in order to fix this problem.

However... Using GEMDOS calls to cauxos under HSModem _always_ produces a "port is ready to send" response; under TurboCTS, handshaking does work. Now, if there were a complete English explanation of how to make HSmodem handshake properly under GEMDOS, or if the default setting would do that, there would be no problem.

IS>And the most interesting thing: You did not send any mail to me.

Right sorry about that - I simply haven't had time. Little things like rent, food, and car payments keep intruding.

IS>There is at the moment only one clear standard for controlling
IS>the serial ports of Ataris, and this standard is supported by the
IS>HSMODA-driver package.

How about a backward-compatible mode or driver for people who don't wantto replace ALL their software just to support the "new standard" method? Since the old way worked - and the only reason I had to switch to HSmodem was to support Semper - it would appear that the "standard" is another non-standard change.

IS>Yes, this standard came late, and it not "atari-official", because
IS>Atari decided to work only for video games in the future, but Atari
IS>is not honestly enough to say it directly.

OK, assume that Atari has dropped computers. I can live with that. Why should I run out and buy all new software that supports HSmodem if I can get all my old software to work fine by switching back to TurboCTS and Binkley instead of Semper? Sure, Semper is nice - but not nice enough to justify the expenditure of several hundred dollars more to replace everything else I run!

2616. Music Studio to MIDI converter...?

Newsgroup: comp.sys.atari.st
Date: 1994-11-09 18:17:05 UTC
From: lunman@ChamplainCollege.QC.CA
Message-ID: <39r3n1$m00@samuel.ChamplainCollege.QC.CA>
Source record: 177058

Hello all. Some years ago, I had a program called PLAYER.PRG which would play back Music Studio song files. Also, it would convert them to standard MIDI files. That's what I need it for. The problem is that I have somehow managed to erase my only existing copy of the program. (I thought I had back ups but...) If my memory serves correctly, it was in the public domain. If anybody has this program or knows where I might find it... Any help would be appreciated!

Thanks in advance for any info.

The specification of TCP/IP doesn't even mention UNIX or
sockets. OK, they may be a logical solution on file-oriented
systems, but for a simple client-only net application, they are
dispensible.

There is absolutely no reason to have the same architecture on my
side of the connection as whatever is on the other end. And BTW,
an FTP server is not always automatically a UNIX machine. It may
be VMS, Mac or MS-DOS just as well.

IIRC two of the chips (glue + video shifter?) were combined into one, and to
do the overscan mod one of these chips needs to be modded in some way.

: Oh, well excuse me for livin'.

: GEnie currently maintains a specific area (called a RoundTable) for Atari
: support including all the machines you mentioned, to some extent. This
: support includes a staff of Sysops, some salaried and some as volunteers
: with limited free access.

Good! Thanks for clarifying! I wouldn't get so ticked off except
that Atari machines underrated because they general populous thinks that
Atari isn't even in business. When you say "The Atari", most of the
population thinks about the old 2600 game system. When you are more
specific (ie. "The Atari Portfolio Palmtop PC"), people realize that
Atari is more than games and take Atari more seriously. It benefits the
Atari community. Sorry if I seem harsh, but the only way the Atari
community can thrive is by maintaining and building upon current support.
We have to let people know that Atari has a diverse product line!

Cheers,

>> Mark <<

Probably ST and compatibles. I can't imagine them going to the
trouble of programming a graphical interface for the 8bits these days.
The Lynx and Jaguar can't even use a modem, and the portfolio is
DOS-compatible.

I've noticed a lot of software I've compiled for Unix machines saying
that it could be configured for Ataris, and I've always assumed they
meant the ST family.

(followups to previous articles omitted)
>
>The Apple CD300e (the new version), for example, can send the audio over the SCSI. Perhaps
>cdaudio.prg is just a panel for managing the CD and cannot map such audio data to the Host
>audio out.

The current version of ExtenDOS Pro supports playing audio CDs through
the audio facilities of the drive, i.e. via headphone or audio-out jack.
(As a side note: there probably ARE drives that support audio but don't
have a headphone jack ... I've just never seen one). ExtenDOS Pro
provides this kind of audio support on many drives from different
manufacturers. The CDAUDIO program/accessory interfaces to code in
the drivers that allows audio CD control. The interface is essentially
the one defined in CDBIND01.H.

Reading audio via the SCSI interface is a different matter. Only more
recent drives support this. It's my intention to add support for this
to ExtenDOS Pro in the (near) future, but I suspect it will probably
be used by most folk for sampling rather than playing entire CDs.
It will clearly take lots of cpu time to process the incoming data
& convert it into something to play through the system speaker, versus
just telling the drive to play the whole CD & going off to do your
compile/dtp/etc.

Regards,
Roger Burrows / Anodyne Software

---------------------------------------------------------------------------
Georg, I remember when the first ST's came along in 1984-85-86? which the
original ST case came in an off white thety did not contain a TOS chip.
You had to boot The Operating System like dos from a floppy disk.
The original Tos 1.0 came on a floppy and had to be loaded into the St in
order to run any type of software. I saw such a machine about 2 years ago
at a friends house here in Orlando, I don't think these machines exist
any more.

In response to graham@insignia.co.uk's message:

> NVDI 3.01 supports Speedo and TrueType. I can't say how well as I don't
> have a copy.

Thanks for that Graham, but I've already got the feature list. I wanted to get a report on how well it seems to do the job and whether there are any reports of problems or advantages over a) the previous NVDI and b) the Speedo aspects.

At the moment I have Speedo v4.1 and QuickST v3 , so I've got the opportunity of either trading in Speedo for NVDI3 at HiSoft for 40ukp or just buying NVDI 2.51 for 30ukp and keeping the existing Speedo but doing without TTs and Type 1s.

Message-ID: <89D646D.0833000848.uuout@cccbbs.cincinnati.oh.us>
Source record: 177324

All,

Cin'tari is having its November meeting on the
12th of November (this Saturday) at 3:30pm at
the Star Bank in Roselawn. 7660 Reading Road.

Everyone is invited to attend. Cin'tari
(Cincinnati Atari Computer Users) supports the
8-bit, ST/STE/TT/Falcon line of computers and
also the Jaguar game system.

This month we will be demoing the Jaguar and
Alien VS. Predator. As always we will have
some computers there also.

We also have Special Interest Groups (SIGS)
that get together to discuss issues such
as Telecommunications, Programming, etc.

If your in the area, please try to make it
to a meeting. All meetings are the 2nd
Saturday of each month at the above place
at 3:30pm. Drop me a note if you want more
info or are interested in a Sig.

Mike Hill

Hi everybody!

I'm wondering if anyone knows if PC-ditto II or I will run on a tt, and
if so, does anyone have a copy?

Is there a file convertor for 1st word to wordperfect?

what is the latest version of spectra GCR?

Does anyone have a copy of wordperfect for the st. Are the file
compatible with pc wordperfect 5.1?

Would it be a better idea to upgrade my tt or purchase a new falcon?
Does anyone know if atari's producing any more computers?

I doubt that it uses the DSP, but I could be wrong. I believe there is a
demo of this program on atari.archive.umich.edu, so that might answer many
of your questions.

```
TOAD COMPUTERS -- HOLIDAY FESTIVAL '94
======================================================================

NEW EXHIBITORS JUST ANNOUNCED: GRIBNIF AND ANODYNE SOFTWARE!

Toad Computers is proud to announce HOLIDAY FESTIVAL '94 which will
take place on December 3rd & 4th, 1994. Last year's event drew
500 people from all over the country and featured guests and
exhibitors such as:

- Dave Small
- Joe Waters, Ed. of Current Notes
- Charles Smeton (STraight FAX!)
- Dave Troy (CN Columnist / Toad Co-owner)
- Tim Reyes
- MajicSoft
- Carter's Creative Computer
- Greg Ondo of Steinberg Jones

We'll feature free hot apple cider, door prizes and more! We'll also
have another raffle to benefit Habitat for Humanity (which raised over
$500 last year!!)

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping
Center in Severna Park, Maryland. There's unlimited free parking and
lots to see and do nearby, as we're nestled between Washington,
Baltimore, and Annapolis.

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Bob Luneski, Oregon Research
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm
```

Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146-2925

Voice: (410) 544-6943
Orders: (800) 448-8623
FAX: (410) 544-1329
BBS: (410) 544-6999
TOADFAX: (410) 544-0098

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other
information you may need, please call us!

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

Keep an eye open for further developments on the show! We plan to have
announcements on and in:

- GEnie - CompuServe
- Internet - Delphi
- Current Notes - ST Informer

We will also be mailing postcards in support of the show
sometime in November. If you know of someone who would like
to come to the show, give us their name and address and
we'll be sure they get the information!

ADMISSION IS FREE!!!! ADMISSION IS FREE!!!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

David Troy
Jennifer Troy
Ray Mitchell

I've already responded to Ben in email, as requested, but in case anyone
else here is interested, let me post some replies to
his message here too...

bensmith@teleport.com (Benjamin Smith) writes:

> Does Flash 2 support VT100\ANSI as well as the Old Flash from Antic Did?? I
> use Flash 1.60 because it supports VT100 Better than FZDT and it works
> better for me on the InterNet. Unfortunately, I also now need to use
> Z-Modem but Z-Modem isn't built in to Flash 1.60. Is Z-Modem built into
> Flash 2 like X-Modem and Y-Modem Batch was in Flash 1.60?

Yes, Flash II *fully* supports VT100 (as well as VT101, 102, 200 & 300) as
well as ANSI. An added benefit to our ANSI support is the built-in
IBM/ANSI character set so that you get full ANSI graphics displayed when
calling an ANSI BBS. We also support ANSI colors, up to 16 of them
depending on the type of Atari computer you're using.

> Also, does anyone have an inexpensive, complete copy of Flash 2 for sale?

If you own an old version of Antic's Flash, you can upgrade to Flash II
for only $30 + $4 shipping (in North Americ). That's one heck of a good
bargain!

> Also, does anyone know what is the current version of Flash 2?

Our current release is 2.21.

> Also, does anyone know the Quality of Flash 2's Manual? And how big of a
> Manual is it and how many pages?

We like to think our manual is one of the best telecom program user manual
around. It's grown to over 250 pages and includes 9 chapters, a full
Table of Contents and a large and easy to use Index for cross referencing.

If anyone else has any questions, please feel free to ask. Thanks.

No they aren't. I have some problems with True Types.
There is another problem... if you have any GDOS font (for screen as i
have) in Motorola format then Speedo just crashes.

> 1) Pagestream drivers. The Laserjet driver will work in mono, but
> I'm wondering if there's a colour Deskjet driver available... I'm
> using an old version (pre-V2) if that makes any difference.

I don't think there's a color Deskjet driver for version 1.8 of
PageStream. If you can upgrade to version 2.2, you'll have a driver
for the 550C which will work with the 560C.

> 3) Paper. Anyone know of a good compromise between plain paper and
> the over- priced HP Glossy stuff?

You might try Hammermill Laser Plus, which tends to resist
bleed-through, or Hammermill Laser Print, which is a
slightly-heavier-than-bond paper. Both are very bright white, tend
not to bleed through much, and produce excellent results with my
Canon BJC-600. I imagine they'd perform very will with the HP
Deskjet as well. Cost: about $10.00/ream for Laser Print, $14.00/ream
for Laser Plus, though you can do better if you shop around.

Hope this helps!

I am using the little brother of Mighty Sonic, called "Eagle Sonic" and I
am very disappointed in the fact that the DSP is disabled when running
in 32MHz mode. I'd also like to see a way to reset to 16MHz without
having to reboot. (It's possible that this has been addressed in a
software upgrade to which I am not privy. Anybody know any more about this?)

From: molin@cxc1.cl.msu.edu
Message-ID: <39s5tu$nhh@cxc1.cl.msu.edu>
Source record: 177361

I've been running a BBS in southeastern Michigan for over 8 years on an XE-based system using the reverent AMIS software (extremely modified, of course.) Now that I've moved up to a Falcon, I have a 2.5Meg 520STfm w/ ICD Adspeed enhancement that I'd like to use as the BBS.

I'd like to see a discussion of the various AVAILABLE shareware and commercial BBS packages that will run on the above ST using a mono monitor and (of course) a hard drive.

Please indicate the following where possible:

1) program title
2) author
3) how to acquire (also, is there a demo available?)
4) price
5) hardware requirements & fastest baud rate supported
6) comments

Thanx!

Source record: 177376

Roland Givan (rgivan@cix.compulink.co.uk) wrote:
: > Has anyone done the overscan modification on the STE with TOS 2.06?

: I don't think you can do this mod on an STE. Something to do with how Atari
: redesigned some of the custom chips :-(

To my knowledge there is no overscan hardware-modification available for the STE.

However, it is not certain that it is impossible, there are some ways of doing it that could work, in theory....

It will be worked on, in a very near future, I'll keep you updated on the progress!

2652. Re: Help with Xferring Atari FTP Files

Newsgroup: comp.sys.atari.st
Date: 1994-11-10 08:24:34 UTC
From: ab164@yfn.ysu.edu
Message-ID: <39slc2$32g@news.ysu.edu>
Source record: 177371

The problem you are having unarcing or unlzhing the files
that you FTPed on a mac could be due to the fact that since MAC
doesn't use file extensions it write header and sometime footer info
on just about every file that passes through it! I ran into some GIF's
that a friend of mine gave to me. Most of my GIF viewers refused to
look at them till I deleted the header info with ED_Hack. I doubt
that this method would work for compressed data, but it is real easy
to see as it is plain text.

I'm looking for a Cable To Connect Between my Navarone Scanner Cartridge and
my Saba Scanner. Does someone know the Pinouts and can they Build me one!

I know Navarone Industries won't help. They don't support Atari Anymore.

I want one Longer than my old one and my older one is getting Worn.

Please, don't reply in the Msg Bases.

Here it is <g>

TTYL

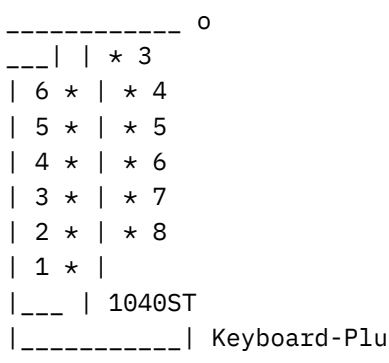
John

---------------------------- snip ---------------------------------

TOPIC=Keyboard Upgrade

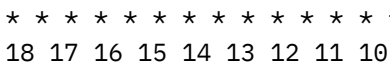
It's no problem to connect the MegaST keyboard to the smaller
computers 520St and 1040ST. To do that, you only have to get
a 6-pin phone connector plug to be connected to the keyboard.
(available in Electronic shops) After that four cables must be
connected with the 'Pfostereihe' (the plug inside the 1040ST)
where normally the original-keyboard is plugged in.
```

The exact connection is shown on picture 2 and 3



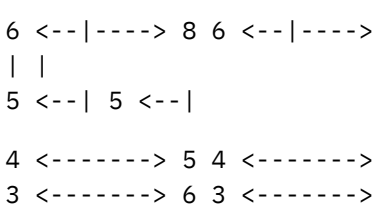
Picture 3

Eickmann Computer, Franktfurt

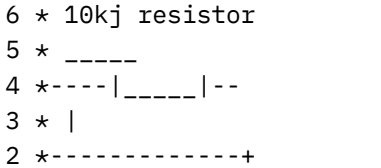


Picture 2 520 ST Keyboard plug (not for You, Jeff)

Picture 3 (Meg to 1040ST) Picture 2 (Meg to 520ST)
MegST MegST
keyboard cable <--> 1040ST plug keyboard <--> 520ST plug



****
And now for No.2
****
If you remove the keyboard from the Mega ST and switch on the
computer, the computer won't boot up and send you a series of
'Alert-Beeps'.
If YOU want to let your Mega ST run without a keyboard
(FAX-Server etc.)
simply connect a resistor to the keyboard-plug in the Meg and
at once there's silence and he'll do his job!



1 *-------------|

Mega ST keyboard-plug
(inside-view)
****
And here's another one: This one's about the Hardcopy-function
of the ST's
****
Do you hate it - after pressing <Alternate>+<Help> the same
time - when you don't have a printer connected to the parallel
port of your ST and must wait a long time to work again because
of the long break the computer takes to realize that there's no
printer connected?
Well, do this and forget about it:

connect the following pins of the printer port of your computer
(better:create a Sub-D 25pin-male-plug an connect the pins on
the soldering side):

pin 13 connected to 14 and 15 (all across the plug)
pin 1 connected to 10
pin 23 connected to 11 and 12
****

Yes, but you still need the resources to cope with that (i.e. RAM and HD
space). Also I was under the impression that the Distribution kit was
quite out of date.

> The GFA BASIC uucico in older version help; and the new version has a
> GEM-based uucico! Sheesh...

You can force the GEM-based uucico to be a text only one without any
problems. Use the option S_MODUS=1 and it shoulf do the trick.

> to OS/2 as well, but OS/2 has some DOS-style foolishness under the hood
> as well.

There was a partly finished port of UUPC to the Atari about 3-4 years ago. I have seen it sitting on a German FTP site somewhere. I actually had a look at one of the later versions of the uucico for UUPC, a couple of months back checking how easy it would be to port. Basically they do things differently, the biggest difference is in th ehandling of the PC's serial port and having an interrupt driven handler to deall with things.

My argument concerning UUCP for the Atari, is along similar lines to the argument being put forward over the Mosaic browser by Annius in this Newsgroup at the moment. Things should not have to rely on all the baggage of MiNT just to run a decent UUCP system. Also there shouldn't have to be compromises on the quality and flexibility of such a package either!

Cheers,
John

2666. Falcon + PC games

Newsgroup: comp.sys.atari.st
Date: 1994-11-10 10:54:21 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <39su4t$rg@lyra.csx.cam.ac.uk>
Source record: 177384

Does anyone know of any games (pd, shareware or commercial) that will
allow you to play using a Falcon and a PC connected to each other via a
null modem cable?

I know of one or two that allow ST<->PC connections (Powerdrome, Falcon)
but I will be using a Falcon instead of a ST, so I'm not sure if this will
work.

Thanks for any help.
Phil

Are you sure about that? AFAIK the DE-signal (Display Enable) is
not available (unless of course you open up one of the chips). On the
old ST it was easy since the SHIFTER was a single chip. You only had
to feed it with a different DE-signal (normally produced by the GLUE)
to get "overscan". On the STE that would be virtually impossible.

Hi, try micros.hensa.ac.uk, and get ESS-Code 6.2 from

micros/atari/tos/n/n172/esscd62.lzh

Also, you may want to get a description of the program before
downloading it. This is in:

micros/atari/tos/n/n172/n172.msg

Hope this helps.

2671. Clipboard

Newsgroup: comp.sys.atari.st
Date: 1994-11-10 11:54:08 UTC
From: matej.kenda@uni-mb.si
Message-ID: <1994Nov10.125408@tferi4>
Source record: 177301

I have a question about using clipboard on STs.
I know how to use system clipboard in editors to copy, paste etc text,
but I would like to know whether is it possible to copy pictures on the
clipboard to pass them to other programs to use those pictures.
(E.g. I draw a mathematical formula and inlude it to my text.)

Are they any programs available for STs similar to the Clipboard Viewer in
Microsoft Windows?

How do I copy graphics to the clipboard if it is possible?
Do I need any programs to do that? If yes, can you advice me any?

Thank you in advance
Matej

2673. WIMPER! My ST world is dying+PET PEEVS

Newsgroup: comp.sys.atari.st
Date: 1994-11-10 12:06:51 UTC
From: udem148@bay.cc.kcl.ac.uk
Message-ID: <1994Nov10.120651.5084@bay.cc.kcl.ac.uk>
Source record: 177305

A major BWAH! Just one of many software titles I have hunted for
is a copy of Microprose F1 Grand Prix through all mail order shops and NO
success. Microprose have long stopped supporting the ST and Grand prix
hasn't been available since, so does anybody out there have an original
copy or dare I say it.....(whisper!-)...a hacked versh? Now this is not
an invite to flaming; I'm aware of the horrendous damage it causes although
in this instance it would make bugger all difference financially to Microprose.

The software base is drying up so quickly and no doubt many ST users
are getting a bit miffed by mail order suppliers (bless 'em) replying with
'weeell, its all PC's nowdays and Amigas, Segas ', and the cheek of it - I have
encountered one intimidating shop owner whose name will remaing anonymous
out of good charity (mate!) giving MOI (still owning 1982 48K Speccy with the
genuine rubber keyboard - remember those?) a bloody lecture, bludgeoning me
about PC software being in the forefront and reasons why:

'blah... ST 16 colours (obviously has no knowledge about various tricks of
getting 512 cols on screen or Falcons, TT's), 3 channel sound only... blah'.

I'm thinking: ' Why buy PC's for games? Granted, nice graphics etc but OK only
if daddy has is loaded' or
'...its'alright; I earn 20 grand plus /annum, + single, therefore can afford to
wander down Tottenham court road in London and liberally splash out 900 quid
for spanking new 486 33 DX desktop, CD rom and the works'.

- and only to find that in a few years time you will be a proud owner
of a machine being the equivalent of a 386 25 mhz of today.
Incidentally, not so long ago I heard that an STFM 520 was going for 50
quid in a local town!

It is interesting though with many posts in this group 'ST pet peeves'
saying people only buy PC's because the pirate software base is outstanding.
You people will cop it eventually when software prices rise rapidly beyond
there already pocket burning 45-50 quid range because of the piracy prob, and
perhaps even the S-base would start to decline. I admittedly can't justify
myself with the above request but I have a bit of an excuse since I can't get
hold of the thing by conventional means less I try just one more thing -
Microprose directly to see if there are any copies in their long forgotten
vaults.

Any pointers, !contibutions! most welcomed. Cheers!

-Al, udem148@bay.cc.kcl.ac.uk-

That's a feature, no bug.
Its documented that they have to be in Intel format. Forever.
There are free available tools to convert the fonts.

There is only one thing I don't understand: *Who* is distributing
fonts in Motorola format when *Nobody* can use it??????????????????????

Hi Merlin People 8-), what i would like to know is, like STARBALL, does
OBSESSION have what i would call SUB GAMES (like eggball etc.), I
have played the demo a few times now, but it does not seem to
have this feature that starball has. Other than that, it is absolutely
1st rate. The stereo sound is excellent (I have a pair of yamaha
monitors connected up) it is about time a game came out with true
stereo for the STE, the scrolling etc. etc. TOP NOTCH!!!

src.doc.ic.ac.uk (146.169.2.1)........./packages/atari/uni-paderborn

- (uni-paderborn, GERMANY)

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
---
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Oh boy... you've gone and done it now, John. You've committed the one truly unforgivable sin here in comp.sys.atari.st... you spoke the TRUTH!

Don't you know that people don't want to hear that here? Let's keep everything all rosy and pretend that Atari Corp still loves us and are hard at work developing new and super powerful desktop computers that when released (Real Soon Now, of course) will take the market by storm and show all those PC and Mac users a thing or two. Yes, all we need to do is be faithful to the fuji and in time, all will be well and our neighbors will once again envy us.

Yeh, you've really blown it this time, John. Heretic! Blasphemer! Sooth Sayer!

'aveagoodaymate! :)

I would hope that people using a computer linked to the internet and
reading a newsgroup called comp.sys.atari.st would be just a tad more
Atari-knowledgeable than the general public, wouldn't you? ;-)

>We have to let people know that Atari has a diverse product line!

How do you define 'diverse?' They are only building ONE product at this
time (the Jaguar; contrary to what some folks would like to believe).
Atari has come full circle, folks. They ARE a games company now.

2696. sale-Atari software, mostly games, cheap

Newsgroup: comp.sys.atari.st
Date: 1994-11-10 17:11:42 UTC
From: jamesd@cg57.esnet.com
Message-ID: <39tk8e$9d2@cg57.esnet.com>
Source record: 177318
Cross-posted to: rec.games.video.atari,comp.sys.atari.st,rec.games.video.marketplace

I have the following Atari ST programs for sale. They are all
original disks but, with exceptions noted, are parted from
their documentation (who reads it anyway?).

I pay postage at the prices shown to anywhere in the US.

The Black Cauldron: Sierra Software, Walt Disney, on 2 disks. $11.

Falcon: Spectrum Holobyte, on 4 disks, $15.

King's Quest: Sierra Software, 2 disks plus a 360 page book
"King's Quest Companion," all for $16.50 (The book by itself is cover
priced at $14.95)

King's Quest II: Sierra Software, 2 disks $11.

Gunship, The Attack Helicopter Simulation, 2 disks $11.

Flight Simulator II, 3 disks (2 are scenery disk) $13.

High Roller: Mindscape, 2 disks, $11.

Typing Tutor Word Invaders: Academy Software $7.50

--------the following programs are each on a single disk----

Jet: subLOGIC $7.50

Dungeon Master: FTL Games, one disk and a 69 page book,
"Secrets of Dungeon Master" $10.

STWars: Miles Computing $7.50

Outrun: Sega $7.50

Major Motion, The Atari ST Arcade Adventure Program: Michtron
7.50

Hades Nebula: Gamebusters (requires color monitor) $7.50

Airball: Microdeal $7.50

Expect to get flamed over the coals. In Atari's last press release refuting Dorfman/Sass charges, Atari states that they have been out and has disposed of the Computer division in '93'.

: |
: |I quite agree on that - even though some native code software would probably
: |come out, too.. But why change the camp, when we have MC 68060..???
: |That thing is bloody fast, relatively cheap (some say..) especially compared to
: |far too expensive 68040, and more or less compatible to current software.
: |
: |Fortunately, Atari has no Windows, nor System 7 (well, I don't like Macs at
: |all) to slow things down. Put MagiC OS into a 68060 Falcon - and there we have
: |one quite nice computer, I think =-) !
: |
: |Tommi

: And who in the world would buy it? The rest of the world demands a stable
: software base on top of an operating system that is feature rich and reasonably
: stable. TOS (or MagiC or whatever its called) still doesn't have long
: filenames,
is implemented in Magic3 (and has installable File system drivers)
: networking,
is/will be implemented with mint net/magic net
:decent user-interface capabilities,
I do not get your point here; GEM based Germanprograms are by no means
inmferior to any Windows/Apple programs in terms of "user-interface
capabilities"
: email support,
see Mintnet above
: etc. Customers
: in the real world demand these sorts of features for their work/business.
of course
: What the hell good is a really fast piece of hardware that is hard to find, hard
: to buy, and has NO SOFTWARE available for it?
I know that in the US there is almost no software available. However, the
USA does not comprise the whole world. There are some very good packages
available here over in Germany.
: Sure, the computer you described would probably sell to a couple hundred
: hacker types throughout the world. That hardly makes a business case.
It is the software that counts and for specific purposes, Atari machines

(or better TOS based machines) have proven superior, e.g. take the MIDI market where Atari held 90% of the market share and even now still has a good position and good chances. The same is true for the DTP market. Of course, again in mainland Europe. Atari has made the mistake of researching, developing a machine for a market, that is thousands of miles away. They should have moved their ST/TT debelopment crew over to Europe.

: If you enjoy using the machine you have now.. great. Continue to enjoy it.
: But if you think anyone else out there is going to put more money into
: developing new Atari computers, you are wasting your time.
Even now we in Germany have Atari computer fairs with new products being announced and developed, and the fairs are much larger than probably all Atarimeetings that happened in the US together
: There is no
: money to be made there. The PC clones and lower price Macs have taken
: any advantage that an Atari computer possibly had.
Go to the ProTOS show in Germany and convince yourself of the opposite.

: Don't get me wrong.. I am still jazzed about Atari. But I think they have a
: good shot with the Jaguar machine. But, the computer products.. they
: are dead.
maybe Atari computers, but not the Operating system. Magic is right now being ported to the Mac and I would be very surprised, if other RISC machines would not follow.

: Its time to wake up people.. Atari's computer products are now antiques.
: Instead of finding Falcon and TT machines in your local dealer, you will
: soon be able to find them at your local swap meets, garage sales, and
: flea markets. The Atari ST computer line is following directly in the footsteps
: of its older realitives... The Commodore 64 and the Atari 800.

: Welcome to the Past, folks. I hope you enjoy your stay here.
We do, and are laughing loudly about the DOS /windows machines with their 640k limit etc... but maybe it is the Americans who enjoy the trip into the future on the back of MS Word and Apple Yuppie toys - in Europe we certainly do not; and by the time magic is ported to non Atari machines, e.g. based on RISC, and we still use future versions of our superior TOS software, you still will wander around chasing for a decent Windows installation.

: (E.g. I draw a mathematical formula and inlude it to my text.)
You can cat anything to and paste anything from the clipboard, as long as your program supports the clipboard. For example, your drawing program would have to support the clipboard. The program you are creating your text with would also have to support the clipboard, and would have to support mixed graphics and text.
: Are they any programs available for STs similar to the Clipboard Viewer in

Hi, I saw your message about Dave Cobbledick and could not agree with you more! :) Obsession does not have sub games as such but has missions which you have to complete to get the bonuses. It has four tables and oodles more playability, so Obsession out rates Starball on every point.

2707. Obsession vs. Starball

Obsession is nothing like the Pd game Starball. Obsession has a lot more features including top quality stereo sound, graphics which are superior and also a ball which obeys the Newtonian Laws of Gravity, not Starball gravity.

Please do not compare Starball to Obsession, it is a bit like comparing a Mini with a Merc.

> 'blah... ST 16 colours (obviously has no knowledge about various
> tricks of getting 512 cols on screen or Falcons, TT's), 3 channel
> sound only... blah'.

Without wanting to side with PCs owners too much - you still have to look at it from the point of view of the shopkeeper. We might be all dedicated Atari owners - but the real money has moved elsewhere. Even the specialist firms will have trouble in a year or twos time as Atari owners just won't be spending any money on anything Atari based. They won't need to as they will have spent the previous 5 years buying all the stuff they need. OTOH Atari owners will still expect new stuff to keep appearing.

This is no criticism of Atari owners though. Its like this with any dying computer system (and to pretend that we are any different is just wishful thinking).

> '...its'alright; I earn 20 grand plus /annum, + single, therefore can
> afford to wander down Tottenham court road in London and liberally
> splash out 900 quid for spanking new 486 33 DX desktop, CD rom and
> the works'.

And many PC owners (and Atari owners) can aford to do just that. Atari owners fall into 2 groups. Those who cannot afford to upgrade, and those who don't want to (maybe because a PC isn't so much of an upgrade to a TT or Falcon). This latter group is maybe bigger than you think.

> - and only to find that in a few years time you will be a proud owner
> of a machine being the equivalent of a 386 25 mhz of today.

But whats new in that? In 1987 a Kaypro 80386DX 16 was the fastest PC in the world (ISTR). Now such machines can be bought for a couple of hundred pounds - and many companies just bin them. Whatever you buy now will be obsolete in 2 years time. Think of all the people with shiny new PowerMac 6100/60s. About 2000ukp fully kitted out now. In 2 years nobody will touch them as they will be very slow for PowerPC machines and won't conform to the current standards. The TT and Falcon are already in this position. Life won't get any easier for them.

Anyway you can't wait for ever. Many high end Atari owners are like me waiting for the new IBM/Apple standard based on the current draft PREP standard and the PowerPC chips. Howver this week it becomes clear that these machines aren't expected to arrive until 1996. Now how will that affect Atari users?:

Well the Falcon is already 2 years old and the TT is 4. All other Atari models are essentially much older than this. Do we hold out until 1997 (when these IBM/Apple) machines become mass market - or do we jump now?

If we jump now (say buy a 486SX33), then by your own logic the machine will be obsolete by the time the IBM/Apple machines are ready. AFAIC its really a question of whether to buy an INTEL based PC (or 680X0/PPC based Mac) or wait for the nect real generation of machines.

If we don't jump now - then many ST owners will have machines which are physically 5-10 years old, and technically much older (the 68000 was designed in the late 1970's) come 1997. True its the cheapest option - but just how much fun can you get out of machine over such a period?

These owners will still be enthusing about getting 512+ colours on the screen at the same time *and* being able to animate the picture (not easy on the ST AFAIK), while more mainstream computer owners will be complaining that they can *see* gradients in colours and the seperate frames which make the animation up.

Although I'm a die hard Atari enthusiast and have just recently bought a TT (August), I'm seriously thinking of buying a 486. True I hate PCs. DOS stinks - and the internal architecture is a mess. But why should I exclude myself from mainstream computing just because I favour a machine (TT) which has next to no support? It also helps that the TT colour monitor works very nicely on a PC :-) - and I can afford to do it. OTOH I'm not advocting abandoning the Atari. A TT is a seriously nice piece of hardware and does certian things *very* well. Also I'm not advocating buying the biggest and best PC I can afford. Why bother? - its only an interim step. PCs are only attractive because they are cheap, popular and flexible. *Not* because there is any long term future proofing in their architecture.

> outstanding. You people will cop it eventually when software prices
> rise rapidly beyond there already pocket burning 45-50 quid range

What more likely to happen is the Atari market will just collapse in on itself. Software sales will tail off and Developers will drop out of the market. Each one that leaves will only make the situation more acute for the remaining. The situation could steamroll.

Whats not clear is if we are in this situation *yet*, or whether we are just in for a bit of a shake down.

Anyway - thats my thoughts for today. Not particulalry pro Atari, but realistic all the same I hope ;-)

:-)

Roland.

>Papyrus Gold is basically a clone of Microsoft Word 4, with a ton of new
>features added in (which feature wise make it very close to Word 6).

I'm not sure if I should take that as a compliment :-)

Fact is, I and the other people involved in the design of Papyrus hardly
knew MS Word or other MS Windows products; personally I don't like their
style of interface design very much. Though I studied computer science,
I found it actually possible to avoid having to worki with MS Windows ;-)

To see what's going on elsewhere we rather look at native Apple Macintosh
and NextStep applications, where new Ideas are often spotted first.
Then we also had some Ideas of our own hat are unique in the computer world
AFAIK (or at least were at the time they first came out) like discontinous
text blocks and the Intelliview Correction.

What is it?

If it is a way to transform binary to ASCII, or ASCII to binary, please
tell me where I can get UNIX source code (or PC source code, but
preferably not) in "C" and I may add it to ESS-Code.

> speed...

While we have made the program 100% GEM compatible, we've also been working really hard on speeding things up. Our current version, 2.21, with a good screen accelerator like Warp 9, easily keeps up at 9600 baud.

> NOTE: Alan Page did not have any thing good to say about FLASH 2, his
> comments was that it still had some of the flaws that Flash 1.6 has...

Alan Page only saw the original release of Flash II back in 1992. It's come a long way since then. One must also keep in mind that Alan Page, at the time, was working on his own new telecom program, Storm, which was to have been a commercial product. It never made it that far. It was released as shareware, but has quite a number of bugs in it, and is mostly non-supported. Our product is fully supported on all of the major commercial bulletin boards as well as here! :-)

If anyone is interested in the program, they should download the latest demo, 2.21.

Thank you Uwe.

While I've got you I do have one other question. I'm looking to buy a replacement hard drive very soon and I know that being able to set parity is important, especially with my Mega STE.

I know there are drives that allow parity to be disabled by a jumper - I have my eye on a Micropolis at the moment - but other drives can only disable parity in software using SCSI commands. Do you have a utility that can send the necessary command or do you know of one that will work with HDDriver and both an Atari host adaptor (internal) and an ICD host adaptor (external drive)?

This would extend the range of drives that are available to chose from.

Many thanks

IM>I've been running a BBS in southeastern Michigan for over 8 years on an
IM>XE-based system using the reverent AMIS software (extremely modified, of
IM>course.) Now that I've moved up to a Falcon, I have a 2.5Meg 520STfm
IM>w/ ICD Adspeed enhancement that I'd like to use as the BBS.

IM>I'd like to see a discussion of the various AVAILABLE shareware and commerci
IM>BBS packages that will run on the above ST using a mono monitor and (of
IM>course) a hard drive.

IM>Please indicate the following where possible:

IM>1) program title
IM>2) author
IM>3) how to acquire (also, is there a demo available?)
IM>4) price
IM>5) hardware requirements & fastest baud rate supported
IM>6) comments

1) ST-Keep (soon to become CaSTle)
2) Andrew STuder (and I'm picking up support for the new version)
3) Download it from GEnie or
STarship BBS (713-682-747, free access, 24 hours)
There's a delay in the logon for unregistered version users, but
otherwise, it's fully functional.
4) Last I heard from Andrew, it was about $25 for registration. I'll
probably go with the same price, possibly raising it a little when I add
Fido-style message bases.
5) Currently requires a minimum of 1 meg and supports up to 19,200. It
will probably want more RAM but go up to 57,600 as soon as I finish
converting source code.
6) Obviously, I like it. Right now it only supports the MODEM1 (or
standard ST AUX:) port, but I'm working on that, too.

It was none other than Tommi Hietavuo that wrote on 3 Nov 94 that ,
TH> BTW: Is Backwards out of FTP-sites today? I haven't seen anything
TH> since 2.52 -
TH> and THAT is sad ;-(

I know ,version's post that one seem to have appeared in only very small number of places . I got it from a BBS in scotland ,who I belieive stumbled across it in Sweden somwhere !!! I hear there is even a V2.72 now! Are versions past 2.52 maybe not freely distributable ? Doesn't say anything about this in the txt file .

TH> Could someone owning it, upload it to UMICH, cnam.cnam.fr (great
TH> place), or into ftp.uni-kl.de ? Thanks!

My access ATM is mail only sorry :-(

TH> slow on falcon, no - but it was kinda depressing to see that the PC
TH> VGA (256 color) version runs as fast - on a 12 MHz 286 (!) .... Not
TH> much left to say,

Are you sure ? I have seen it run on a 386 and it was not the speed that impressed ,but the enhanced display was nice.

WAs it you that asked about the F1GP editors ? For what its worth the authors of the Amiga and PC versions are

Steve Smith steves@sound.demon.co.uk
Simon Harmel simon.harmel@cbox.seuk.com

respectively
they are not going to be interested in an Atari version although they might give you some tips on how to do one yourself :-)

TH> I'd like to say: F&&& MicroProse for letting us down.. But by
TH> abandoning Atari

Microprose went near bust and were only rescued by Spectrum Holobyte's intervention As I understand and it is likely there intervention that cut the Atari support .

IW>The HSMODA drivers *are* backwards compatible.

No, they most certainly are not. I have tested extensively, and most of
the software I use (BBS, door interface, Fido-style reader, ad nauseum)
will NOT use the handshaking HSMODA provides. It reports "port ready"
at all times under GEMDOS, even when the modem is actually waiting on a
CTS from the remote end.

2720. Re: Help, new tt owner

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 05:00:22 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <39utp6$k26@golem.wcc.govt.nz>
Source record: 177262

] I'm wondering if anyone knows if PC-ditto II or I will run on a tt, and
] if so, does anyone have a copy?

Surprisingly, PC-Ditto does work on a TT. It runs at quite an acceptable speed, although, still only in CGA mode which isn't a lot of use these days! :) It also still only emulates an XT.

PC-Ditto II would probably not work, as it has a hardware section which was designed for ST technology, and required pieces would quite probably not be compatible.

The more recent AT emulators (AT-Once, AT-Speed C16 and some other one whos name eludes me), _probably_ would work, albeit with varying degrees of success. No doubt someone around here has tried at least one of them! :)

] Is there a file convertor for 1st word to wordperfect?

I know there's one for WP to 1st-Word, but as for the other way around... If you can, FTP to atari.archive.umich.edu and have a look through the /atari/0index file.

If you don't mind losing bold-text etc. You can just save the file as plain ASCII and then import it into 1st Word and vice-versa.

] what is the latest version of spectra GCR?

v3.0. Version 3.1 has been going to be released "Really Soon" for the past couple of years.

] Does anyone have a copy of wordperfect for the st. Are the file
] compatible with pc wordperfect 5.1?

Pass. I still use good old 1st-Word Plus.

] Would it be a better idea to upgrade my tt or purchase a new falcon?
] Does anyone know if atari's producing any more computers?

Depends. The only advantage the Falcon has over the TT, is basically in the sound & graphics department. The TT for most practical purposes is a lot faster. AFAIK it's marginally more compatible as well. However, if you do a lot of MIDI or whatever, or art related work, then a Falcon might be worth having a look at. Be careful though, they ain't cheap!

At the moment, Atari is having virtually nothing to do with anything other than the Jaguar. AFAIK Compo is managing the Falcon now, and _possibly_ the TT. Anyone want to expand on/correct this!?

2721. Transplanting SH204 innards . . .

Newsgroup: comp.sys.atari.st

Message-ID: <39v37e$r0@usenet.INS.CWRU.Edu>
Source record: 177266

I remember talk on this semi-recently . . .

How easy is it to upgrade the 20 MB mechanism in the Atari SH204 hard disk drive? In my usual optimistic hopes, I would think that all I need to do is buy a SCSI drive and stick it in. I know that the SH204 has an extra converter (SCSI-RLL?) that I should unplug or something . . .

Any help will be greatly appreciated! Thanxz.

There are only commercial programs available for this purpose. There is a
demo version of OUTSIDE on ftp.uni-kl.de in /pub/atari/other_demos which
gives you 2 MBytes of virtual RAM on drive D:.

I've written a procedure in Lattice C. to read the Enhanced (Jaguar) joypad.
If someone reminds me next week I send it to the newsgroup and/or upload it
to atari.archive.

It's dead easy if you have the Atari Compendium but requires a BIG
'switch/case' statement!

Any Atari fair in Germany I have seen throughout the last years could not
convince me to stick with Atari. Atari's are currently either too slow or
overpriced (Medusa etc.). Furthermore, there is no freeware for the area
I am working in (gene technology), but there are lots of freeware in the
Mac, PC and Unix areas.

Even if MagiC is ported to the Mac I doubt that it will become more than
an operating system for people who want to abandon their old, slow Atari
Machines but stick with their programs. A Mac user certainly will not
switch to MagiC. BTW, to my knowledge MagiC is ported to 680x0 Macs, not
to a Power PC platform, so your statement about "other RISC machines"
makes no sense.

> We do, and are laughing loudly about the DOS /windows machines with their
> 640k limit etc... but maybe it is the Americans who enjoy the trip into
> the future on the back of MS Word and Apple Yuppie toys - in Europe we
> certainly do not;

This US <-> Europe controversy does not make any sense to me. Don't forget
that the most innovative free operating system today (Linux) is developed
on a intel-based platform (although ports will become available in the
future). Additionally, the number of Atari vendors in Europe is steadily
declining. Additionally, there is no discussion that System 7 is much
better organized than TOS ever has been. Additionally, ...

Have you ever worked with other computers than your Atari?

I think you should keep these kind of comments to a advocacy area anyway. This area is for Atari-owners who likes to help each other and give advise on how to make the most of their machines in their everyday work. AND not destroying each other with pathedic comments that leads to nothing but angry comments.
I say it again - That belongs to an advocacy area, where people who likes to disguss such time-wasting subjects can give their oppinions.

Have a nice day. :-)

2734. PONG 2000 Demo, What's your opinion

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 14:24:40 UTC
From: vdleij@phil.ruu.nl
Message-ID: <vdleij-1111941524400001@ana-dyn-25.mac.phil.ruu.nl>
Source record: 177288

Hi, as the PONG 2000 demo should be available through several archives now
or else very soon, I would like to know what your opinion is about the
game. It's Falcon030 only. Please reply through mail or here.

Joost.

Source record: 177350

Hutch,
I'd have to disagree with you quite a bit about your statements.
Just because Atari has moved does not mean that the Atari community
will just disappear. There is still a solid base of support which
I think is proven by the number of CD-ROMs coming out for our machines.
I had serious doubts about a market for CD-ROMs on such a small
platform but I have seen many Atari-specific disks.
The Atari market won't stand still as long as there are software
coders out here supporting it. Amazing products have come out
in the shareware market like Griff's MPEG player. Wizztronic's
Barracuda is now available. There is talk of 060 cards, the Medusa
is out, I have heard rumblings of another clone.... The Atari line
is not dead because of the community and not Atari.
As far as the competition goes I cringe at the thought of using
the other OSs out there. Windows is sad. Maybe Chicago (but I
doubt it from things I've heard) but not Windows. And System 7.5?
A 25Mhz 68030 LCIII crawls compared to my Falcon running this beast.
Not to mention the RAM needed to run System 7.x.
One problem with the computer market is that "advances" are coming
too fast. Programs come out that need a mininum of 8 megs of RAM
for instance. In the Mac and PC world one needs to upgrade to
keep up. The current systems are powerful enough to handle most
tasks but the programs need more and more resources. These programs
also seem to be more and more expensive....
Right now what computer system would you suggest, Hutch? There is
always going to be the promise of something "better" around the
corner. If you suggest a PowerMac, I'd suggest waiting for the
Prep compliant machines....
The Atari can handle, I'd say, 90% of users' needs. Would you not
agree, Hutch?
Hope you took this as a friendly disagreement not as an attack.
I am just sick and tired of hearing how outdated my Falcon is and
how great PCs and Macs are considering I have used both and would
not switch for anything. In my experience, PCs are game machines
with an occasional Word session and Macs ae just slower than they
should be (nice software, though, but it is expensive).

From: jensk@hpbbn.bbn.hp.com
Message-ID: <JENSK.94Nov11090614@hpbbrn.bbn.hp.com>
Source record: 177215

Thomas> To my knowledge, NVDI 3.0 as well as SpeedoGDOS 5.0 support all kinds of vector fonts but NVDI 3.0 is able to use these fonts even without SpeedoGDOS.

NVDI 3.0 supports Speedo and TrueType fonts, but not Type1. I *think* that SpeedoGDOS supports Type1.

Thomas> Is theire any advantage using NVDI 3,0 and SpeedoGDOS 5.0 together or is it enogh to use NVDI 3.0 alone ?

The NVDI documentation says that NVDI 3.0 shouldn't be used together with SpeedoGDOS.

Thomas> Is an upgrade from NVDI 2.5 to 3.0 available ?

Here in Germany, yes. YMMV.

Bye,
Jens.

Apart from realistic ball movement, which is better in Starball.
The ball in obsession seems to be made out of either rubber or lead -
depending of course on which you don't want it to be... :)

: Rumour has it ATARI are going to start making ST's again; hopefully
: this time with room to expand. Don't know when though!

From what I gather Atari have always ran off small batches of ST's and TT's
for the last few years. I doubt they will make a huge quantity but I do know
(well I think I do) that they have around 10,000 on sale this Christmas.

2746. wordperfect

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 17:30:22 UTC
From: nicole@seas.smu.edu
Message-ID: <1994Nov11.173022.24453@seas.smu.edu>
Source record: 177267

Wordperfect tech no longer supports Wordperfect for ST.
Only ASCII files are portable between ST and IBM Wordperfect versions. (You can't work on your ibm file in the st, and you can't work on your st file on the ibm unless you've saved them as plain ASCII text.) How do I know, I've tried with every option in WP5.1 and WP6.0 on ibm and WP4.1 on ST. I also called Wordperfect, and I had to phrase my questions as if they were about ibm-pc WP6.0.

There may be a utility floating around that converts files from one platform to the other and vice versa, but I've never seen it: only ones that convert either platform to ascii, which loses the special elements you'd wish to keep such as bold/italic/etc.

Ciao

2747. FPU with Adspeed problem

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 17:41:32 UTC
From: selick@bu.edu
Message-ID: <3a0acc$s9l@news.bu.edu>
Source record: 177261

I just installed a 16 mhz 68882 FPU in my ADspeed STe board. I soldered in a 16mhz oscillator like it says in the directions, and then plugged in the chip. Sysinfo 2.1 (Stfax system info program) does not recognize that I have a FPU installed.

Is it possible (probably) that I destroyed the chip when I de-soldered it from the old board it was on? I did have to heat it up quite a bit to get it off.

Any help would be nice, and any offers for another chip 68881/68882 16mhz or better would be neat too, if it's not been soldered in before.

Thanks,
Steve

2748. Atari US on TOS 5

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 17:41:54 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94315.124154STIRRE31@MAINE.MAINE.EDU>
Source record: 177270

Well, I asked Atari via e-mail about a new TOS version and they
replied that they have no short term plans on releasing one.
It was expected, though, right? They seemed pretty firm on this
decsion but they werr very polite. And, as if we needed to hear
it again, Atari is focusing on their 64-bit game system, the Jaguar.
Oh well. When's Magix coming out for the Falcon :-)?

That's what I said: Flip two jumper _wires_ (or zero ohm resistors, if you prefer that).

I'd like to add a warning, too: Some STEs have their TOS soldered in.

bye, Peter

2750. Re: US/European Mega keyboards: diffs?

You're a bit wrong. European Atari and DOS style keyboards do have an extra key
compared to the US versions: The left Shift key is smaller, and there's an
extra normal-sized key to the right of it, having '<' and '>' (plus '|' on DOS
keyboards).

bye, Peter

2752. Midi Sysex dumps ?

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 19:02:06 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <11111994.190206@empyr.dircon.co.uk>
Source record: 177281

Hi, I'm looking for a prog / acc that will take a midi system exclusive dump from a keyboard and save it to disk, WITHOUT changing the format of the data. I have several progs that will *send* sysex data to synths but the couple that I have that receive, save the data in their own weird format.

Any ideas ?

Cheers.

2753. NVDI sys file ?

Newsgroup: comp.sys.atari.st
Date: 1994-11-11 19:02:09 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <11111994.190209@empyr.dircon.co.uk>
Source record: 177282

Hi,

I have managed to trash a file called NVDIDRV1.SYS in NVDI 2.03, and
before you all say I should have kept a backup, no I didn't. OK :-(

Has anyone got a copy of this file they could uuencode to me ?

The other NVDI files are fine, as far as I can make out, so it's only
this one I need.

Thanks in advance.

Kevan@empyr.dircon.co.uk

Well, since it's now been a few years since I got rid of my ST, it's
probably time to get rid of the books, programs, etc. that I kept in case
I ever got another one ... If there's no manual listed, it's because I
couldn't find it after a hurricane and two moves 8^).
Here's the list:

Books -
original asking
Compute's Atari ST Volume 1: VDI $19.95 $10
Volume 2: AES $19.95 $10
Volume 3: TOS $24.95 $12
Abacus Atari ST Peeks & Pokes ..... $16.95 $ 8
Tricks & Tips $19.95 $10
Graphics & Sound $19.95 $10
Sybex Programmer's Guide to GEM $19.95 $10
Atari ST Basic Sourcebook (large format) offer
Atari ST Basic Sourcebook & Tutorial (small format) offer
Atart ST Owner's manual (dunno why I still have _this_ ...) offer

Mapping the Atari (8-bit) ..... $14.95 $ 7

Software -

Personal Pascal v2.? disks & manual ...? offer
Tackle Box ST & TB News 1&2 disks & lg. binder manual ...? offer
Prospero Pascal for GEM v2.151 disks and manuals ...? offer
FunctionZ function key labeling (disk only) ...? offer
PageStream 1.8 (disks only) ...? offer

Misc -
DeskCart (probably needs new battery), disk & manual ...? offer

Sadly, I have to agree that Atari computer is out of it. I say sadly,
because I really think that the ST was a GREAT machine, if it only had
the availability (marketing and distribution) and software to go with
it. I have a 386 with 4 Megs, CD-ROM, sound card and Windows and many
times long for the things I had with my 520 ST (FM). I had to sell
mine to upgrade (?) to an IBM PC (mainly because of software volume)
about 4 years ago. So if the predictions of the prophets are
true and anyone has even a 520 ST with Degas Elite (Don't even care if
you got a monitor, but I do want the RF output) and is selling it at
swap meet, garage sale or flea market prices, please let me know. I'm
interested. :)

Longing for the days when using a computer was fun and didn't require
500 megabytes of hard disk space,

Mitchel Soltys

No, not GFA-BASIC is crap in general, but it's possible to write crap
with the help of _any_ language.

> However... Using GEMDOS calls to cauxos under HSModem _always_ produces
> a "port is ready to send" response; under TurboCTS, handshaking does

> HSmodem handshake properly under GEMDOS, or if the default setting would
> do that, there would be no problem.
Sorry, but I think you didn't read the SERSOFST.TXT and the other texts
carefully. Because "AUX" is crap (I believed that nobody used it in the
past because it produced additional overhead over calling the BIOS Bco*
directly) it isn't supported. Open a "U:\DEV\MODEM1" if you like to
use MODEM1 and it will work. AUX is crap eg because the assigned BIOS-
device could be changed via Bconmap.

> Right sorry about that - I simply haven't had time. Little things like
> rent, food, and car payments keep intruding.
Sorry too, but I'm even not payed for doing what I do. And I need the
feedback.

> How about a backward-compatible mode or driver for people who don't

> method? Since the old way worked - and the only reason I had to switch
> to HSmodem was to support Semper - it would appear that the "standard"
> is another non-standard change.
Backward-compatible, what do you mean? All BIOS-calls are still supported
(and became much faster) and they may be mixed with GEMDOS-calls without
problems (but it's not recommended).

Because the AUX was very bad, it wasn't supported (and if I should support
it, you will have to do a Fopen to AUX, using only -2 Handle without
Fopen would create to much trouble with other programs). If there are
many american or english programs using this, how shall I know about it
if nobody writes a mail.

In Germany there are sold only very few non-german communication
programs. (I don't want say something about the possible reason)

Hello, I was wondering if anyone knows how to get in touch with the author of World Conquest (it as an EMPIRE type of strategy game). I had some questions and comments for the author but my message bounced when I used the e-mail address specified in the docs.

Has anyone played this game? I think it has great potential but the user interface is CR*P.

> There's a patch or something, isn't there?
>
There is a program called silboot 2e (on
micros.hensa.ac.uk in micros/atari/tos/o/o170
which installs an executable boot sector onto
a floppy disk. This sets the memory to 2.5MB
and also waits for your hard-disk to initialize
(if you have one).

I have had no problems with this program and it
is certainly faster than using an auto program
(and more convienient).

Definitely recommended

??? AFAIK RTS/CTS handshaking is between DTE (computer) and DCE (modem),
not between local and remote modem. Could you please elaborate?

And what exactly do you mean by `the software ... will not use the
handshaking HSMODA provides'? AFAIK HSMODA will use the handshaking
that your software instructs it to use (i.e. the handshaking is
implemented in the driver, not in the application).

: present.

I've seen a RamBoard that allows you to have upto 12 megs on a STE.
It's called RamBoard Deluxe and comes in ST and STE versions.
Don't know if the ST-version supports 12 megs.

Anyway, the company selling the stuff here in Sweden is H|gdata, and I
think they get it from Indigo 2 in Denmark.

Ok, when I looked around in my very messy pile of pricelists, I did find
Indigo 2's pricelist, and yes, they had that RamBoard.

Article Price (DK including Danish V.A.T.)
RamBoard Deluxe Mega 0/12 795 DK
RamBoard Deluxe STE 0/12 795 DK
RamBoard Deluxe ST 0/4 595 DK

To get an approximate price in dollar, divide the price with 7-7.5.

I think it is a very good price indeed for such a Ramboard.

Anybody who'd want to get in contact with Indigo 2:
Telephone: +(45)86 20 16 55
Telefax: +(45)86 20 12 04

Hope this clear things out!

: >
: Does anybody know where Hard&Soft can be contacted and how much
: this TOS/IDE card costs?

While I still had Indigo 2's pricelist out, I'd thought that I'd answer
one of your questions...

The TOS/AT-bus board comes with or without TOS 2.06 Eproms.

Article Price
TOS/AT-bus with TOS 2.06 895 DK
TOS/AT-bus without TOS 2.06 495 DK

(Divide by 7-7.5 to get price in dollars.)

As you can see, the board is very inexpensive!

: >
: > However, it is not certain that it is impossible, there are some ways of
: > doing it that could work, in theory....

: Are you sure about that? AFAIK the DE-signal (Display Enable) is
: not available (unless of course you open up one of the chips). On the
: old ST it was easy since the SHIFTER was a single chip. You only had
: to feed it with a different DE-signal (normally produced by the GLUE)
: to get "overscan". On the STE that would be virtually impossible.

As I stated, it could work, at least in theory.
But that depends a lot on the internal architecture of the chips in STE,
which is yet to be tested.

With the "right" architecture, it would be possible with a minimum of
external logic, with the almost "right" architecture, it would need a lot
of external logic, (and that could turn out to be a very expensive
solution) and with the wrong architecture it would be virtually impossible.

There is a copy of Insignia's SoftPC on the latest COMPO CD-ROM. This should do everything PC-DITTO 1 ever did. Only works on a TT or Falcon though.

> Does anyone have a copy of wordperfect for the st. Are the file
> compatible with pc wordperfect 5.1?

AFAIK WP 4.1 files load into WP 5.1, but not the other way arround.

> Would it be a better idea to upgrade my tt or purchase a new falcon?
> Does anyone know if atari's producing any more computers?

The TT is considerably better in shear CPU power than a Falocn. Unless you need the extra graphics modes or DSP, then I'd stick with the TT.

:-)

Martijn Dekker (mdekker@fwi.uva.nl) wrote:
: This I don't understand. there is nothing wrong with the hardware of a
: 486DX or Pentium. Maybe you mean you don't like DOS or Windoze (this I
: would understand) ? There are other operating systems for PC's you know !
: (notably Linux and Warp)

I do not agree with you, PC is a big pain in the a**!!!
Last week my father bought a PC for his company (to use with accounting
software and such), as I'm the one in my family who knows computers, he
left me in charge of installing it.
(Just for the record, I have never, ever, configured/setup'ed a PC
before, I have used them though)
It took me 3 days to learn MS-DOS/Windows and the hardware good enough to
let me install everything so that my father could use the darn machine
(he has NEVER even touched a computer...).
The hardware:
486DX2/66, SCSI-2 Fast 1 gig hdd, SCSI-2 CD-rom, SVGA 1mb, 16mb memory,
conner 250 tapebackup, SB 16 etc. (he let me decide what to get. :)

What I have learned during these 3 days, is that the PC is a very stupid
design. Have you ever tried to optimise the conventional memory?
It's a nightmare, with all necessary drivers, he had only about 450kb
conventional memory left, before I optimised it. (ended up with 618 kb free)
Everybody that has used a PC knows that the conventional memory is the
key to all good software on the PC.
(Convenional memory is the first 640kb of the total memory, when you
optimise it, you move drivers to the memory between 640kb and 1024kb and
the first 64kb in the second 1mb page, and you have to mix it in between
I/O areas and BIOS areas used by the hardware etc)
Memmaker that comes with MS-DOS, is supposed to do that for you, and do
it good, but it does it really bad, and shuldn't be used.

Then we have the hardware, setting up all cards is also a nightmare, you
have to make sure that all expansion cards use IRQ's I/O-adresses,
BIOS-adresses etc that noone else is using, which isn't easy, one mistake
and you end up with a machine that isn't bootable.
Again, the software that comes with MS-DOS is insufficient, and shouldn't
be used (it even f*cked up my mousedriver so badly that I had to switch
off the computer for several seconds to get it working again!)

Then I had trouble with the conner 250 tapestreamer, called the swedish
support, got my self a real PC-lamer that suggested that I would get new
hardware, told him to f*ck off, got a pirated copy of conner backup exec
and it worked like a charm. (Conner backup exec is the streamer soft that
you have to buy, Conner backup basic comes with the drive)

Since the basic version didn't support my hardware/streamer, I won't pay them a cent for the exec version since I have to use that to get a working drive. Anyway, I'll never get hardware from conner again, not as long as they have support that s*cks!

So you tell me, is PC really a computer to go for?
I think not, the hardware s*cks, the software s*cks and putting it together s*cks even more.

Whoever invented the darn system ought to be shot on the spot!

Regards, Tommy

d>
With all that I hate to ask ... but..... I saw a rumour that it would
only work on an F030 .....fact? If so, how about TT & 030'd ST's?
How about two monitor support ie: I have a CrazyDots VME in my MSTe and
would find it useful to use the 19" mono there for my main monitor, but the
SC1435 could be used to display the work another program was doing [or just
watching system vectors etc to see what causes errant crashes etc on my box]
in a med res of 640x400 (monSTEr, of course ;^))
Thanx for keeping us informed. I look forward to compatibility reports
as well, of course :)

H> What about Walnut Creek? A new *GEMini* out from those guys?

I know that SUZYB [that wonderful PD library for the ST] is issueing a 2 disc CDROM set with over 10500 files, their present full catalogue.They have gone through the files and cleaned out older versions, plus each file has a descriptive text included. There is [supposedly] little duplication from the GEMINI cdrom. All files are in uncompressed form: one disc is mostly games. $69.95US + S&H etc. Well worth it in my opinion, and YES I am getting mine!

ps. Dont tell anyone, but he has already got enough material to almost fill another cdrom disc, but is waiting to see the response to this effort.

b> Hmmm, I wonder if there has ever been instructions for building such a
b> board published anywhere (perhaps one of the highly technical German ST
b> magazines)?
I understood that the XtraRAM was only presently available for the ST
series of CPU. They are 'thinking' about the MSTe. A BigRAM board will soon be
released for the MSTe that uses 72pin simm for up to 8 meg additional.
I misunderstood your original post! I felt you were saying that there
was a way of putting an extra 4 megs into the MSTe _without_ useing another
mmu or ram daughter boards, or vme cards.
I wish those German mags were online and in ENGLISH ;^)
Jon
ps btw, those 1-800 numbers dont work in Canada ;(

: Have you ever worked with other computers than your Atari?
Of course I am working with other computers, too, and I am forced to do so
at the university. We have quite a tile of Macs and Pcs with Windows and
Linux installed. As for the discussion of System 7 as compared to Magic,
there is one going on, on the Mausnet in Atari.soft, the newsgroup is
crossposted to the Internet as maus.sys.atari.software, I won't start a
discussion on that as a follow-up to the original message. But there are
certain features in one operating system, that are not available in the
other, that will b always the case, even with Windows (or did you see
System 7 supporting sth. like OLE 2?). It is your personal believe on how
successful future Magic deelopments may be, but, as compared to
anemulator, it will be a fully featured OS, actively supported and not
just a means for nostalgic people to run there old software, just as they
run maybe XL Software on the XL emulator on the Atari. Mac users might not
switch to Magic (which makes no sense, as Macamagic and System7 run
parallel), they just mightz wish to use good Atarisoftware professionally,
such as Calmus SL, DA products, Papyrus etc... It is true that the first
version will only support 68k macs (68030 upwards), but it is definite
that a PPC verion will follow. There is also no reason, why Magic
could/should not be ported in native code to other RISC plattforms as well
and I take any bets that this will happen. I must admit, though, that my
posting was a little bit too emotional, but this is due to John Townsend,
who has worked for Atari before and who carries thus also a responsibility
for the misery at Atari concerning computers. Do not forget, though, that
Magic has nothing to do with Atari, it is beingprogrammed by the same
people that did NVDI and other well known excellent programmers(Andeas Kromke-

Atari Magic Kernel and AES, Thomas Tempelmann- megamax modula 2, Macmagic ....).
As for the success of operating systems, I do not think that any of us can really say, which one will be the standard for the future. But I think, as John Townsend has worked for Atari, it is time that we should talk about his involvment in the Atari market (see sperately posted article.....)

Bye,

Alfred

Hi John!

Ihave been reading with interest your comments on Atari computers, especially the one where you critisised that TOS would not stand up to its competitors, in terms of features, networking etc.... I got an old German Atari newspaper here that states that a certain, high rankingAtari person, a system programmer for Atari, namely John Townsend, has quitted Atari for Taligent software. If you are not that person and anything inthat last sentence is wrong, I will by all means excuse myself and ask for apologies. But if you are that person (which I think is highly probable), then I am little bit puzzled.

I mean, if someone is haveing a job at a company, he has to stand up usually in the morning, get to work at around 8,9,10 am and stay till in the afternoon. I assume you also did this, I also assume that you got paid for doing work for quite a period of time at Atari. Now, on the other hand, I am looking at TOS/GEM, which is a work mainly done by DR and the things Atari did with it. Now, during the period you worked at Atari, the things the system programmers did, were:
some bugfixes and adaptations to STE and TT
TOS2.06 desktop
modular control panel
Considering what other programmers did during the same time, I kindly ask:
WHAT DID YOU DO AT ATARI ALL THE TIME?
drinking coffee? playing games? I think the amount of work you did at Atari gets you a pure "F" , a 5% score at most. If you critizise Atari TOS (which, BTW and to your knowledge of Atari computers has nothing to do with "Magic or so") , then you are ciritizising your own work. One of Ataris biggest mistake was not to fire people like you (there are still some left.....) earlier, people , who do nothing, consume money, much erlier. It is a shame, that a company as Atari has to, because you were incapable, buy tghe kernel for the operating system from someone else, who programmed in his freetime. What was your commitment to the Atari system software? Now let us assume, youare far from being a decent programmer: Why did you not at least document existing OS functions? Why no support? Now, after you quit Atari, you appear in discussion groups, now, when nobody actually needs you and your comments.
It also puts a bad light on Taligent, if they hire you. It is quite a time, when i had a discussion with a person, who dows not like Atari (and his arguments are objective) about futuere operating systems and he was shocked to hear, that programmers from Atari were working on Taligent. I suppose you atari newsgrouop activities take place during your freetime and not during working hours at Taligent, don't they? Now, as Taligent is far from being finished and far beyond schedule, and I even can guess the reason (Townsend and Co.) I will glady buy Microsoft shares, because

whatever you are doing there at Taligent, if you are working the same way as with Atari, it cannot be of acceptable quality.

Sincerely yours,

Alfred Radauer

I remember John well from the days when I frequented (you'll pardon the expression) GEnie. Aside from being a member of the TOS Development Group, he was perhaps Atari's single most visible online representative and all-around cheerleader.

The simple fact of the matter is that Atari has NOT been breaking gorund in the areas of connectivity, expansion, etc., on either a hardware or OS level...and frankly, they've been playing a pretty darn pitiful game of follow-the-leader, when it comes to those points. Atari has not been keeping up with industry developments; it's the truth, and sometimes it hurts. If you choose not to accept that, it's up to you, but let's not kill the messenger here, eh?

I'd really like to know how you intend to connect to the Internet
without it. Or is your Mosaic going to be a local-document-only (ie,
not too useful for most wanna-be 'net surfers)?

>This would be really hard to do in a fool-proof way. Anything wrong
>in the auto folder and the system hangs (forever, if you're a naive
>user...)

You could always put another little program in first that asks if you
want to load MiNT in anticipation of using your program; if they answer
"no", just rename mintnp.prg to mintnp.prx. This'd also safe-guard you
from crash-city.

RATSOFT....RATSOFT....RATSOFT

I would recommend Ratsoft. Call my board at 909-621-3737 and see Rip graphics on an Atari board! The authors BBS is 909-481-1927. The author is Steve Hughey. I bought the BBS package over a year ago and there have been at least 12-14 updates...one a month...not just bug squashing either...online spell checking, RIP graphics, Internal Fido Messages, Forem Dat files, Full Screen Editor Online, Auto file_id.diz extractor, a very nice BBS package. The best for the Atari. Runs on all Atari with 1 meg or more and cost a meager $90 or so. Supports all serial ports ever made for Atari....

My second choice would be Transcendence, but it costs almost as much and has less available for it as fa as add ons go.

>You forgot to add 'hopefully'.

No, it _will_. Even if Atari has nothing to do with it (hey, you didn't expect them to actually _sell_ it, or make it available in stores, did you?).

>Atari is too much 'dead' for still having one standard. As anyone
>knows, there are some 3--4 standards around today.

This is true.

>The TMP variable doesn't have a meaning on the Atari. It is UNIX.
>Here's my objection to MiNT: it blindly adopts 90% of UNIX. I wish
>people had used some more phantasy.

MiNT's objective was to make it easier to port UNIX programs to the Atari. If environment variables are such a UNIXy thing, why does NeoDesk support them (and has forever, AFAIK)?

>I presume you planned to use TOSWIN as a front end? Ugh.

Sure. It's no work for the programmer to support TOSWIN. Actually, I'd probably hack up a quick GEM app that did vt100 in a window and that was it, but then you'd require MultiTOS, or Geneva, or MagiC.

>That's what commercial developers earn their living with, isn't it?

I really don't think there are any commercial developers earning their living on the Atari platform.

>It would be *very* hard to write an install program that installs
>MiNT and MiNTnet so that it works on any system.

That really depends on how much crap they have sitting in their AUTO folder, and c:*.acc.

>I am merely investigating my options. My conclusions so far are that
>from a programmer's point of view it is definitely easier to go for
>MiNTnet, but from a user's point of view, it seems that built-in
>support is more important.

But, if you have to write everything from scratch, you'll miss the "window of opportunity" for Atari software; I really doubt there'll be a market left for commercial Atari software by this time next year.

>I don't want to participate in a project that makes every Atari
>look like a bad imitation of a UNIX box. If that's what you want,
>get a cheap 486. Atari must remain Atari at all cost.

There is no such thing as a cheap '486 for a hardware-bigot. There's no way in hell I'll buy a system with IDE drives and such a stupid architecture. It's just a pity there aren't any affordable MIPS or PowerPC systems worth talking about. The chips are cheap, but the systems aren't.

Because Atari _has_ remained Atari is the reason this platform is in such a terrible state, and the reason why the Jaguar's future is _still_ in doubt. I guess the Tramiels like to keep us on the edge of our seat.

It's easy if you support sockets properly (hell, NetScape does it on
non-multitasking, non-multithreaded Windoze). Ok, maybe not easy, but
if the browser is designed with this in mind, it'll be much nicer.

Source record: 177226

Roger,
I disagreed with Hutch and Mr. Townsend. There is no "truth" here, it is subjective. Would you call Windows technically superior to TOS for most uses? If so, fine, but I refuse to deal with the program manager instead of simply popping in a disk and clicking on the drive icon. I like the trash can. I like being able to install programs simply by copying the file to the drive. Call me crazy if you wish.
As far as the CD scene goes, there are 4 or 5 PD collections out including a 2 disk collection from Toad and Suzy-B. There's the Qwikforms CD from Sterling, Audio CD Master to play audio CDs, there's a program to play the Encarta CDs I believe, and there's Photo Show from It's All Relative. Not only this but we can get disks full of GIFs and other pictures, FLI files, and fonts. Not too bad in my opinion. I don't want games on CDs personally. I'll stick to my cheap Lynx for these (and my new 7800).
I don't have "blinkers" :-) on (I am not driving a car right now) and realize that the Atari market is not supported as much as the Mac and PC markets. So what, though? GEM is so much nicer than System 7.x (IMO) and Windows (in almost everyone's opinion). With Macs and PCs you will also be expected to upgrade. Have to keep up with the times, ya know. These pretty little PowerMacs out today will be left in the cold when something better (like the Prep Power PCs) comes out. Do you advocate buying every new gadget that comes out when the Falcon is a perfectly capable machine? If so, expect to buy a new system every year. This is just not an option for me.
TOS may be outdated (althought it is faster than System 7.x and offers many of the same features) but there is development in the market. What about Magix? The Atari is not dead as long as people use it and is not outdated as long as it does the job.

> (he has NEVER even touched a computer...).

Not to be picky or anything, but everything you complain about here is software based, not hardware. As the poster above points out, a Pentium 90 running LINUX is one hot box. All this really means is that PCs have been dragged into enough evolution to provide alternatives to the various ancient paradigms that really make them irritating. A good example would be the linear address modes in 386 and higher processors (no 640k conventional memory delimitation). Your problem is that you are using software that sucks (and you have little choice, if you want to use "mainstream" applications).

> What I have learned during these 3 days, is that the PC is a very stupid
> design. Have you ever tried to optimise the conventional memory?

> conventional memory left, before I optimised it. (ended up with 618 kb free)
> Everybody that has used a PC knows that the conventional memory is the
> key to all good software on the PC.

You are absolutely correct, but your hardware has the option of not segmenting memory at all. Unfortunately, MSDOS won't let you take advantage of it! Windows will, but that does little to stave the agony of having to work with that awful environment.

I do get massively irritated when I find myself fighting for a few bytes of conventional memory on a 32mb PC that could out-perform the SPARCstation on my desk! So, I can certainly relate to your experience.

> Then we have the hardware, setting up all cards is also a nightmare, you

> Again, the software that comes with MS-DOS is insufficient, and shouldn't
> be used (it even f*cked up my mousedriver so badly that I had to switch
> off the computer for several seconds to get it working again!)

Again correct. However, the IRQ stuff is quite easy to set up IF you have some decent diagnostic software. As you point out, the software is what failed you. The hardware flexibility one has with PCs is worth a bit of bother, though there is no excuse for not including a decent diag package with MSDOS to make it something other than black magic (then again, my "chief sorceror" position is fairly safe :-).

> Then I had trouble with the conner 250 tapestreamer, called the swedish
> support, got my self a real PC-lamer that suggested that I would get new
> hardware, told him to f*ck off, got a pirated copy of conner backup exec
> and it worked like a charm. (Conner backup exec is the streamer soft that
> you have to buy, Conner backup basic comes with the drive)

Again, software.

> So you tell me, is PC really a computer to go for?
> I think not, the hardware s*cks, the software s*cks and putting it
> together s*cks even more.

To clarify, the hardware has great POTENTIAL to suck, based on what base OS is used. The MSDOS/Windows OS environments do suck, no potential about it. After having dinked with several fast LINUX systems, I can say that these are quite cool (given that one is a UNIX person). I have heard that OS/9 is much nicer than MSDOS (a statement that might be saying very little :-). PC hardware can be really neat when the MSDOS/Windows shackles are discarded. Of course, then one is something of an "outsider" (gee, does that sound familiar to Atari owners....).

> Whoever invented the darn system ought to be shot on the spot!

They were darn clever folks, back in, oh, 1982-3 or so. Back then, this kind of thing made a lot of sense, what with engineering limitations and all. Until fairly recently, one did not buy a PC for performance. They were bought so an existing software base would not have to be scrapped. Due to market realities and some massive engineering efforts, we now have machines that are, paradoxically, really really fast and in some ways braindead as far as design goes. However, most of the "braindeadness" can be turned off in modern hardware. The mainstream OS software still has to catch up. Believe it or not, there are still a lot of companies out there that want to run code that was originally developed back in the early 80's (stuff that they paid mucho bucks to have written). To be able to do this, the market has to sell machines that can be just as primative (in some sense) as those sold during that time.

Don't get me wrong, I'm not beating the PC drum or anything. I guess my point is that software is everything, and that MSDOS/Windows is the real problem with most PCs IMHO, and the consumer computer market in general. I stick with my Atari systems because the software is cool/fun, not (obviously) because I demand extreme performance. Mac people will understand this as well, as Macs were notoriously slow for many years compared to PCs (Mac zealots didn't care, and mostly still don't, as the software is soooo nice in so many ways when compared to the PC platform).

Heck, be happy that you are an Atari enthusist. You have experienced a computer system that is truly easy and fun to work and play with. That is what still draws me to them, even though I am surrounded by various "hot" boxes. If the realities of your situation require that you have a "mainstream" platform lying around, buy a bigger desk and set them both up (best kind of multitasking). Atari stuff can be amazingly competant and useful for many "serious" things as well, though to a degree this will probably fade with time. There is some great stuff out there, and it is mostly dirt cheap nowadays.

Ah well, just my $0.02.

2803. Incredible Atari Sales in The Netherlands!

Newsgroup: comp.sys.atari.st
Date: 1994-11-12 18:24:58 UTC
From: sanders@sci.kun.nl
Message-ID: <Cz635M.JKq@sci.kun.nl>
Source record: 177228

Hi,

I got the November/December issue of Atari St Nieuws today, and spread over the center pages there is an amazing display of Atari stuff for sale. To quote some: SM 194 of TTM 194 (19" monitor) for DFl 499,-, Portfolio starting at DFl 79,-, Lynx for 99,-, Mega ST1 for 199, and even a real ATW Transputer incl. keyboard for 599,- (!!!) ST i.o-card and ATW Farmcard with 4 T800's also 599 each. No need for an 060 card for my Falcon: I could get this beast and place it under my desk, and have a MiNTnet connection to it (yes?) That'd be great... I can wait to see TeX zap those page numbers across my screen :-) I have a review of those ATW's somewhere... I'll look up some info on them.

Check out your local exchange rate for DFl and be amazed...

Regards,
Sander STOks.

For the guy asking about manuals for Cubase. There is a place in the US that sells not the manuals but two books that show you how to use each command. (I believe they are superior to Steinberg's own manuals)
One is called The Official Cubase Handbook
The other is Addendum for the Official Cubase Handbook: Atari 3.01 and Macintosh 2.5 & Cubase Score.

They are availble from a company called Creative Input. Their number is US Code 310-548-0218 and if you are in the US you can reach them free at their 800 number. 800-839-INPUT

Source record: 177227

I've tried this question in other locales now I'll try it here:
As an Atari enthusiast who by dint of market forces and modern ways was forced to join the PC world (kicking and screaming all the way), I want to know if it is possible to use my lovely old 4 meg STE and Atari laser printer as a printer for a PC. That is use the STE/laser printer combo to emulate a PC-compatible printer. Has anyone ever (reliably) achieved this result?

(For those of you who follow PI calculation and are just as crazy as I am on the subject - "Yes, Virginia, I'm *still* at it!".....)

Gio Ciampa of Birmingham, England, is on the verge of releasing GIO_PI8S.TOS which has an upper limit of 53 billion digits of PI. All earlier versions of GIO_PIxx.xxx (as well as all other author's programs) had various limits of perhaps 59,000 or 200,000 (depending on the version) because of the way division routines are handled.

On a stock Falcon030/16MHz, it takes about 20 minutes to calculate 20,000 digits, and the time to calculate further x times digits is x^2 minutes. (All times are 4.5 times slower on an 8 MHz ST.) Thus, on a stock Falcon, this 68000 compiled program would take 247 years to calculate 53 billion digits (although on a 4 meg machine, you're limited to about 3 million digits. Rats, eh?). Gio is still trying to perfect fast multiplication routines.

Gio is trying to get ahold of a 68030 programming book to perhaps do a Falcon specific version, which also may make use of the DSP chip.

If nothing else, Gio is learning a hell of a lot about programming. Me, I am trying to find a place to store all those digits!

Still crazy after all these years.

: Read were the post came from all the Old Atari TOS Programers now
: work for Taligent, they have more than likly played with more computers
: than we have had dinners...
Is this supposed to say anything? John Townsend worked as a systems
programmer for Atari and I am wondering how a person can work for such a
long time and produce so little. Is it clear to you, that those people
never went beyond a control panel and a simple graohics shell while they
were being paid by Atari? They even had to buy the kernel of the
multitasking system from a person programming in his freetime, they never
were able to hold deadlines and they even were not able to produce some
kind of documentation. If you say, they played with more computers than we
had dinners, I am taking it word by word. I even can imagine John playing
Doom on his PC during working hours at Taligent. BTW, did you also notice
that Taligent are far from being on schedule with their operating system?
That people evem did not see anything from Taligent except announcements
on low level routines? To consider him an expert or a professional and
thus giving more weight to his statements is only possible if he can show
references. And a control panel anda TOS 2.06 desktop hardly qualifies
John as such an expert, consiedering the time it took to develop those
"powerful" tools, and his work at Taligent is far frombeing visible to the
public. I stated all the above critics into an open letter to John, let us
see if he hast guts enough to answer it and give an account on what he did
at Atari.

If a firm like DMC (Calamus) still bothers to develop professional DTP software for Atari compatible (!) computers - and now I mean also Medusa T-40 / T-60, Eagle, etc. - then many others will, too. This is a living market - no matter if some of us don't seem to like it or not ;-) ...

> The Atari system is way outdated, that is a Real FACT, so take those stupid
> blinkers off, then may be you will see the trees from the woods....
>
> As they say dream on.....

Dreaming on ;-) !

I disagree with you - and (surprise..) believe that we will have Atari compatible computers for many years, much better operating systems, and some very good software for them. And you know why? Because people like me will buy Atari-based soft- and hardware not only today, but also tomorrow.

Stupid, isn't it?

I don't think so.

Here's one thing some people don't seem to understand: some of us buy computers that we _want_. Unlike those people who buy PCs, because "everybody else does". That makes a big difference. You may ask me, if I'm crazy for using a computer "nobody else uses". I really couldn't care less; Atari is the computer I like to use - and as long as there are lots of people like me, there will be enough hard- and software support for us. That's a real FACT too, isn't it?

You say the machines are outdated. Maybe they are - maybe they are not. But who really cares, if they do the job..? Should we become as crazy as those PC and Mac freaks that buy a new computer every year, when 486-586-686-... based new models appear? Does that make any sense to you?

By the way, I respect everybody's right to speak his/hers mind - but I can't say I like messages (in some computer's support area!) that yell: "This computer you use, is old-fashioned, doomed, its manufacturer is hopeless... So, come on - let's SAVE ourselves! Let's abandon this ship!!!".

Who does that attitude help? Nobody, I think...

Also, calling people who clearly _like_ their Falcons, etc. blind (willing to forget the truth that the computer they use is crap..), isn't very nice either. I think that we would all buy a better computer, if we found one. We're not really _that_ dumb, or fanatic, are we?

So - I think we use the best computer system (for us, that is..)
- and the other people may use whatever they like to use. It's good that we still _have_ alternatives ! Otherwise everybody would have to use Windoze (or maybe Falcons ;-).

Cheers,

Tommi (still a _very_ happy Falcon owner...)

In line with the comments about Taligent, I have no reason to believe that Taligent will turn out to be any better written than Windows 3.1, Windows NT, System 7, and OS/2... and we know how blindingly efficient THOSE OS's are.

The hardware is getting faster, and companies would like us to believe that it's getting cheaper too (I don't care what you say... a 1gig HD is NOT cheap!!). Just like Microsoft and everyone else, Taligent is going to (or already has) get lazy and write LARGE, INEFFICIENT code because they think the hardware is fast enough and the user has enough memory that they can get away with producing garbage... just like Microsoft and Apple has done all along.

Just to run Windows NT (and no apps), you need 16 megs of RAM, hundreds of megabytes of HD space, and a 66mhz 486. Even then, it's EXTREMELY slow.

To run System 7 at a decent speed, you NEED a Quadra, with a large HD, 4 megs of RAM just ISN'T enough, and the whole mess is still a pain to use. It's the most sluggish OS I've used.

Taligent has not yet given any reason (than perhaps promises) for us to believe that their OS will be any better.

2814. Offers? Awesome TT prepress system for sale...maybe

Hello... I have the following system that I will be entertaining offers
for... it is an awesome system for the right buyer!
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
TEN megs ST ram,
SIXTEEN megs TT ram... (26total)
TTM194 19inch monochrome
PTC1426 TT color monitor
8 bit color video card (coco)
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.

This is designed as a professional publishing and image retouching
system... the system was designed for the DIDOT/RETOUCHE suite of
programs which are not included, but easily acquired from various sources.
Please direct offers, inquiries and replies to:

Helle gang.
After following this debate it becomes more and more obvious
that the main problem here is not whetever the Atari Computer
range is dead or not, the problem is that we won't accept it.
I'm not surprised that Atari's given up, just look at the
Falcon, Because of the fact that the Atari user family
will not accept an Atari that's not compatible with the
old ST software, the Falcon is a fraction of what it could
have been. There would maybe still be a chance for Atari
Computers (If atari corp. would take it.) And that's jumping
on the train With IBM&Apple and Motorola in creating a totally
new standard for personal computers. I think that Atari could
do a lot of good there, sincehow innovative Hardware has always
been atari's forte'.
And since the new standards going to be as flexible as possible
to different harware setups as possible, Atari could really
revive their Computer section....
But they won't.
Cuase let's facce it, no matter if the Jag's a success or not,
Atari's promise to stay with us is bound to be broken.
and the next computer we buy will be made by apple or IBM.
Maybe we should pump Atari to join in with Apple and IBM
instead of whinging for a new TOS platform...
Besides , thoose new machines will be so tough that they'll
run *any* TOS software under a software emulator faster
then any TOS platform in existence.
I'll keep my Falcon solely for the Music.
(But I do wish that it were really 32 Bit and had bloody
32 bit memory and not this 16 bit crap...:( )

Peter.

From: mparrott@pnw.net
Message-ID: <3a3ou4$rml@rocky.pnw.net>
Source record: 177051

WordPerfect files _are_ transportable between PC and ST versions of the program, but only in WP 4.x format; _I_ know because I've done it before, and on a regular basis. Text attributes remain intact. What one has to keep in mind is, when working on a higher version of WP on a PC, the file has to be saved in WP 4.x format (not the higher version's format). Naturally, things such as graphics and line draw are lost, but for most documents this isn't a problem.

There is a program to convert between various word processor formats, called WP Switch, and if I remember correctly it will covert to and from WP 5.1, WP 4.x, 1st Word and ASCII formats (possibly even RTF, but I don't really think so). The program should be available from Toad Computers (1-800-448-8623) and should be under $35.00.

i am anxiously awaiting this titles for both the ST and Falcon to arrive
from the supplier's. I never read anything about it requiring the
32MHRZ. That is news to me, why would they want this from the Falcon as
99% of us Falcon users do not have excellerated machines???
Although we sure would like it, not that the DSP isn't doing the trick!

As the base of ST users increase on the NET, we would definitley benefit
from using a MOSAIC type program. I read about a PC product called
InterNET in a BOX. It sells for $149.00 American dollars.

I have already had several users inquire about such a product.

Definitely interested in this product....anything that makes the NET
easier to access. Please keep us posted and put me on your mailing list
for product info:

>

Please tell us why you would want to trade??? Although it doesn't
surprise me. i had a fellow who called us and was beginning a MIDI/Music
classes at University. He told me there wasn't anything on his PC, except
for MIDI that an ST couldn't do.

We also carry the Atari Jaguar Console and I had a fellow call yesterday
that wanted to buy a Jaguar just so he could free up 22 megs on his 270
meg hard drive and play Doom on the Jag. Go figure!!
Talk about over head on the PC. Give your head a shake, I thought!

2832. A Kick in the pants

Newsgroup: comp.sys.atari.st
Date: 1994-11-13 05:39:20 UTC
From: ekl@sdf.saomai.org
Message-ID: <Cz6yDs.2rI@sdf.saomai.org>
Source record: 176798
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'd like to give my system a kick-in-the-pants. Currently I'm looking for information and a Zyxel 19.2K modem U1496+E (at least I think that is the right model number). If you have such a modem and would be willing to sell it, give me your price, exact model number and ROM revision, and asking price in US dollars (including shipping and COD to Texas, USA).

Now, the information I'm seeking :

I want more information on something called the MegaBoard - it supposedly allows an ST user to add an additional 8MB of RAM, an IDE hard disk interface, and an ISA card slot suitable for graphics cards such as an ET4000 or similar. I want price (US dollars, availability information, and what the installation is like - will it wire onto the same motherboard as an STe AdSpeed? On the STe at all?)

Next, the GE-Soft Eagle Sonic was released. A TT clone with a 33Mhz 68040 CPU (66Mhz internal). I want to know video resolutions, RAM, bus speeds, upgradability, case designs, availability, hard disk types supported, typical hard disk and memory configurations, serial ports and which chips are used for serial IO, and anything else you can tell me. I'd like prices in US Dollars for a bare system, and one with 4-8MB RAM and a 240MB hard disk. I want all the technical and financial details you can get to me!

Last, I heard the Medusa T60 was released, I'd like the same info as above, but also CPU speed infor for both the 040 and 060 versions of the Medusa system, same configurations and such as above.

Oh, and if anyone has a used TT030 they would like to sell a couple months down the road, drop me an e-mail about how much you would want for it, and complete details on the system.

Thanks,
Evan Langlois

There is a program called STRip that is available for monochrome users only, I think. I got a copy form GEnie if memory serves. It should be available for ftp from Atari.Archive.Umich.Edu STRIP.ZIP is the name I think.

Monochrome rip is OK, but not as good as ripterm for a DOS Box. There migh also be something for the MAC too if you have spectre.

Let me know haw STRIP works with Ratsoft if you call...

Actually, I have played both versions, and the F030 version does
sorta run kinda slowly. It will be the version that I will buy,
unless the jag version is better, though. Wicked game - I know
of very few games where you get to amputate parts of your body!

Even faster than the Medusa T60, Eagle (w64040 or 68060) or the coming 040 and 060 boards from Progemtec that can be fitted to ST/STE/TT/Falcon? I think it will take quite some time before software emulators on PPC's can do this, but what do I know?

:: This I don't understand. there is nothing wrong with the hardware of a
:: 486DX or Pentium. Maybe you mean you don't like DOS or Windoze (this I
:: would understand) ? There are other operating systems for PC's you know !
:: (notably Linux and Warp)
:
:I do not agree with you, PC is a big pain in the a**!!!
:Last week my father bought a PC for his company (to use with accounting
:software and such), as I'm the one in my family who knows computers, he
:left me in charge of installing it.
:(Just for the record, I have never, ever, configured/setup'ed a PC
:before, I have used them though)
:It took me 3 days to learn MS-DOS/Windows and the hardware good enough to
:let me install everything so that my father could use the darn machine
:(he has NEVER even touched a computer...).
:The hardware:
:486DX2/66, SCSI-2 Fast 1 gig hdd, SCSI-2 CD-rom, SVGA 1mb, 16mb memory,
:conner 250 tapebackup, SB 16 etc. (he let me decide what to get. :)

so you recommended a PC? ;-)

:
:What I have learned during these 3 days, is that the PC is a very stupid
:design. Have you ever tried to optimise the conventional memory?
:It's a nightmare, with all necessary drivers, he had only about 450kb
:conventional memory left, before I optimised it. (ended up with 618 kb free)
:Everybody that has used a PC knows that the conventional memory is the
:key to all good software on the PC.
:(Convenional memory is the first 640kb of the total memory, when you
:optimise it, you move drivers to the memory between 640kb and 1024kb and
:the first 64kb in the second 1mb page, and you have to mix it in between
:I/O areas and BIOS areas used by the hardware etc)
:Memmaker that comes with MS-DOS, is supposed to do that for you, and do
:it good, but it does it really bad, and shuldn't be used.
:

Yes, DOS s*cks. So why use DOS? I said that there are very good OS's for
PC's and I didNOT say DOS was good.

:Then we have the hardware, setting up all cards is also a nightmare, you
:have to make sure that all expansion cards use IRQ's I/O-adresses,
:BIOS-adresses etc that noone else is using, which isn't easy, one mistake
:and you end up with a machine that isn't bootable.
:Again, the software that comes with MS-DOS is insufficient, and shouldn't

Again your problem lies with DOS, not with the PC itself.

:be used (it even f*cked up my mousedriver so badly that I had to switch
:off the computer for several seconds to get it working again!)
:
:Then I had trouble with the conner 250 tapestreamer, called the swedish
:support, got my self a real PC-lamer that suggested that I would get new
:hardware, told him to f*ck off, got a pirated copy of conner backup exec
:and it worked like a charm. (Conner backup exec is the streamer soft that
:you have to buy, Conner backup basic comes with the drive)
:Since the basic version didn't support my hardware/streamer, I won't pay
:them a cent for the exec version since I have to use that to get a
:working drive. Anyway, I'll never get hardware from conner again, not as
:long as they have support that s*cks!
:
:So you tell me, is PC really a computer to go for?

well, yes. We got our IBM Aptiva (486DX2/66, 12Mb RAM, .5 giga hard, cd-rom,
sb 16 etc) yesterday, and we had NO problems AT ALL installing everything.
In fact it came with Windows 3.1 installed, and it was very easy to
install OS/2 Warp. Absolutely no problems. And please remember that I never
used a PC before.

:I think not, the hardware s*cks, the software s*cks and putting it

again you mean DOS s*cks.

:together s*cks even more.
:
:Whoever invented the darn system ought to be shot on the spot!
:

bull.

:Regards, Tommy
:

Well, have fun to rewrite your (and commercial) programs for ATWs :-)
(As a matter of fact, I have seen an ATW once (four or five years ago, at
the computer science dept of Edinburgh U., and it _is_ a fast machine.
But your Atari code doesn't run on ATWs: you would have to recompile the
source code, probably fit it to the ATW-ST interface, etc. So save your
money for something else.)

>*will not* accept an Atari that's not compatible with the
>old ST software, the Falcon is a fraction of what it could
>have been. There would maybe still be a chance for Atari

Maybe Atari as a piece of hardware is "dead", but the fantastic
thing about Atari is, that even if it's dead it's alive and well
on many people's desks - why? Because there are and will be programs
that are so ingenious, effective, well designed and unique and...
they run only on Atari.

The important aspect of being an "Atarian" is, that you have a machine
that is very different compared to the mainstream-computers (= you are
not like 10 million others), and that you have a thorough feel about
what's going on in your computer when you use it:
I hate in every other OS, that the system writes constantly on the
disk, installation procedures that forces you buy a separate book
and an unistaller program, and you have to have all sorts of files
in specific places to e.g to be able to use the printer.

Would IBM user family accept an OS that woudn't run old existing
software? How about the Mac-friend, would they like to get a new Mac
that can't run their favorite applications? Even if the only
sensible thing from both companies would be to write a completely
new OS that would have *nothing* to do with recent snails.

>Maybe we should pump Atari to join in with Apple and IBM
>instead of whinging for a new TOS platform...

Why don't we create a *one* computer model and build *one* shop so that
people have no choice but to buy it? Read your Orwell.
Even if it would be nice to be able to run Atari-programs on e.g. SGI,
I wouldn't want that the only thing you can buy is a SGI.

>Besides , thoose new machines will be so tough that they'll
>run *any* TOS software under a software emulator faster
>then any TOS platform in existence.

Well, there are now computers that are able to do that, if there would
be software to do it. I recall hearing a story about DMC Calamus SL which
was rewritten for Macs - but the developers found out that it ran faster in

TT that in any Mac --- the power (drain) of OS is immense.

>I'll keep my Falcon solely for the Music.

One good program is a perfectly good reason to buy a computer for it.
I have it also as a main tool for composing, but thought the net I've
collected also other software, that has made some of my PC-owners
quite itchy - e.g Connect 2.46 is a program that thay have been looking
for their PC:s - and still are...

>(But I do wish that it were really 32 Bit and had bloody
> 32 bit memory and not this 16 bit crap...:( )

Acclerators etc. are available. Can you really be disturbed about
the number of bits while you're doing somethin' like composing?

2845. Mail Problems

Newsgroup: comp.sys.atari.st
Date: 1994-11-13 16:33:34 UTC
From: mark@forsyth.demon.co.uk
Message-ID: <941113Z163334.970mark@forsyth.demon.co.uk>
Source record: 177125

Help I'm haveing a bit of a problem in setting up a mailing list. I am using NOS with Mailer and have specified a couple of mailing lists in my Alias file but all I get is a mail message sent to the first address in the list.

I have also had problems with aliases set to the same name as some of my mail boxes. Could anyone either tell be the correct syntax for the Alias file (ot if it is possible) or the name and ftp site of a better mailer.

The only reason I am still using mailer is because I don't know what there is available that is better and I havn't had the time to look, but sending the same message to 15 to 20 addresses is getting to be a pain in the neck.

It is a special BIN-ASCII converter used by some atari-applications to
store a screen-snapshot...

You are able to get it via anonymous ftp from
ftp.tu-clausthal.de /pub/atari/archivers/other/scode.lzh

Bye,
Wolfgang.

2847. Dutch translate ?

Newsgroup: comp.sys.atari.st
Date: 1994-11-13 16:46:54 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <11131994.164654@empyr.dircon.co.uk>
Source record: 177082

Hi, I just got hold of a 'fax program for the ST', but after running it, I don't think it is what I thought it was. The docs are in dutch, so I cannot even read what it's supposed to do. Can any NL readers translate a part for me ? I won't copy the entire file, just the first couple of paragraphs, so other users don't have to d/load a large file in their mail.

Begin:

Allereerst een korte levensloop van het programma.......

Toen Elektuur in het Januari nummer 1989 een convertor publi-
ceerde, waarmee het mogelijk was om fax persfoto's en weer-
kaarten te onvangen op de Atari ST in grijstinten heb ik geen
moment getwijfeld om deze decoder te bouwen. Zelfs het overmaken
van een gering bedrag en het sturen van een diskette leverde bij
mij geen probleem op.Toen de diskette (sneller dan verwacht)
arriveerde, heeft het precies 3 minuten geduurd om de computer op
te starten en het programma en de hardware aan het werk te
hebben.

Groot was de teleurstelling toen de melding op het scherm
verscheen: "Sorry, Hi Rez only". Maar goed, toch maar op de
monochrome monitor gedraaid, en inderdaad, het werkte. Maar Baal
oh Baal, waar waren de beloofde grijstinten ??

etc etc.....

Any ideas ?

Oh, and don't forget the brain-dead instruction set and idiot hardware design of the Intel processors.

Yeah, I want a processor that's so inefficiently designed that to get it to compete with an 040, it's got to run at twice the clock rate and produce several times as much heat.

And you can't really improve the hardware design much because the kludged patch-work instruction set limits the efficiency of the processor. Oh, and of course, the odd and small register set, etc, etc, etc.

With all that I hate to ask ... but..... I saw a rumour that it would
only work on an F030 .....fact? If so, how about TT & 030'd ST's?
How about two monitor support ie: I have a CrazyDots VME in my MSTe and
would find it useful to use the 19" mono there for my main monitor, but the
SC1435 could be used to display the work another program was doing [or just
watching system vectors etc to see what causes errant crashes etc on my box]
in a med res of 640x400 (monSTEr, of course ;^))
Thanx for keeping us informed. I look forward to compatibility reports
as well, of course :)

H> What about Walnut Creek? A new *GEMini* out from those guys?

I know that SUZYB [that wonderful PD library for the ST] is issueing a 2 disc CDROM set with over 10500 files, their present full catalogue.They have gone through the files and cleaned out older versions, plus each file has a descriptive text included. There is [supposedly] little duplication from the GEMINI cdrom. All files are in uncompressed form: one disc is mostly games. $69.95US + S&H etc. Well worth it in my opinion, and YES I am getting mine!

ps. Dont tell anyone, but he has already got enough material to almost fill another cdrom disc, but is waiting to see the response to this effort.

b> Hmmm, I wonder if there has ever been instructions for building such a
b> board published anywhere (perhaps one of the highly technical German ST
b> magazines)?
I understood that the XtraRAM was only presently available for the ST
series of CPU. They are 'thinking' about the MSTe. A BigRAM board will soon be
released for the MSTe that uses 72pin simm for up to 8 meg additional.
I misunderstood your original post! I felt you were saying that there
was a way of putting an extra 4 megs into the MSTe _without_ useing another
mmu or ram daughter boards, or vme cards.
I wish those German mags were online and in ENGLISH ;^)
Jon
ps btw, those 1-800 numbers dont work in Canada ;(

> tirrell

Well the answer to your questions are:

1) It is
2) Who knows!
3) Who knows!

Actually its status is in limbo AFAIK. Its made it way onto a CD-ROM, but thats not to say the CD-ROM compilers had any right to put it there - I just don't know. As for a floppy release - then somebody could copy it off the CD-ROM as distribute it - but it won't be me ;-)

BTW its still pretty much BETA and there is no support for it.

Roland.

AFAIK, MiNTnet is tar'd and gzip'd, so you'll need to do this:

```
gzip -d -c mintnet.tgr | tar -xovf -
```

Or, if you don't like pipes:

```
gzip -d -v mintnet.tgr
tar -xovf mintnet.tar
```

The usual file extension for tar'd and gzip'd files on DOS filesystems
is .tgz, or .tar.gz on better filesystems.

I sent him E-mail in September,got a reply in October (he does not have
access during holidays). It is best to write him a letter (same address as
in the docs).

I agree that the game is really good, but the only problem I have with the
user interface is that it won't let you change stuff after the game has
started.

It's by postorder only !!
Don't have the address right now and since I'm off for a couple off days :-)
it will take a time before I can post it.(maybe somebody else has it).

But for those of you who are lucky enough to attend the PROTOS in two weeks,
ACN (the publisher of Atari Nieuws) has a stand there.

Regards
/Rob

Hmmmmm, not liking pinball in any form would mean that this probably isn't your kind of game. But I think that most people find pinball fairly enjoyable and quite addictive. This is one of the few games that I will play for any length of time (in fact the only game). It's so so addictive (and sometimes frustrating!)

Alas I must now bid this group farewell.

For reasons which I will not mention (flame prevention) my ST is now being sold. My days with Atari are over.

I must say, however, that this group has been one of the friendliest and helpful bunch of people I have conversed with on the net. There's something about the Atari scene that seems quite homely.

Anyway, goodbye.

Ronnie

In article <3a1rs9$sce@aristotle.algonet.se> jonaeson@algonet.se (Tommy Jonaeson) writes:
>It took me 3 days to learn MS-DOS/Windows and the hardware good enough to

If you use an ATARI, I don't see why it takes you 3 days to learn how to use Windows. Most stuff are similar, click and drag etc. Infact, the program groups are great idea, having stuff that do the same thing together, otherwise the new Neodesk would not have followed them, right?

I think the transition to use Windows is less than 2 hours as GEM really prepares you for it. It did for me, for that matter I can use X-windows without any help the first time.

Installation of DOS and windows is a breeze. They have auto install program that will do it for you in less than an hour. In fact most software that I have installed can be done in less than an hour.

>The hardware:
>486DX2/66, SCSI-2 Fast 1 gig hdd, SCSI-2 CD-rom, SVGA 1mb, 16mb memory,
>conner 250 tapebackup, SB 16 etc. (he let me decide what to get. :)

You're lucky to start off with a fast PC, I started off with a 286.

>What I have learned during these 3 days, is that the PC is a very stupid
>design. Have you ever tried to optimise the conventional memory?

Nowadays, software are a whole lot better, some knows how to use EMS so that there is near to 0K usage of conventional memory. It is just afew option setup on the software.

It is the software that you're using that is really the problem. Get and use smart software.

>Then we have the hardware, setting up all cards is also a nightmare, you
>have to make sure that all expansion cards use IRQ's I/O-adresses,
>BIOS-adresses etc that noone else is using, which isn't easy, one mistake
>and you end up with a machine that isn't bootable.

Now this is a area that is normally a nightmare to most ppl. Read the manual! and use a good diagnostic problem to find out what is used and what is not. Also try using the newest DOS, they allow you to skip loading device drivers at boot time, so you can boot up bare without any drivers.

I must say that this is a problem caused by to much support for the machine. There are so many HW products upgrades for the machine while the machine have limited available IRQs/BIOS addr for them all. I wish that my MSTE have all these HW upgrades, so that I am not stuck at standard 4 colours for med res or just 4 Meg RAM. Also with so many HW product available, there is alot of competition and it drives the prices down.

>So you tell me, is PC really a computer to go for?
>I think not, the hardware s*cks, the software s*cks and putting it
>together s*cks even more.

Yes and no. Yes, For normal office and home usage due to the tremendous HW and SW support available. No, for a techic, wait a machine that can run both PC/Mac (and possibly Atari ST/TT/falcon) stuff on it, if it ever come.

>Whoever invented the darn system ought to be shot on the spot!

It was the state of the art technology in 1980s. And at that time the ST was far better than XT, but if only ST have develope in the way XT have...

I am not blowing the trumpet for PCs. Come off it, I don't believe that millions of people are wrong by chosing PCs rather than Atari, Amiga or Apple machines. Remember back in the late 70s and early 80s there were tons of other make of machines (Dragon, Brain, Speccy, ZX 80/81, QL etc) that have all gone down the drain. In this market it is the survival of the fittest and PC looks like it is and will be breaking into the workstation market in the very near future.

Regards
William

I have completed deutros but find that there is space left for discoveries.

I have got:

derick
rframe
tool pod
supply pod
cyno^H^H^H^H people pod
shuttle engin /frame
inter planet engine / frame
inter stella engine / frame
He stuff fuel
H CH4 fuel
communicator
grapple
amu
acc
bandaid
resorce frame
battle dronw
star drone
2 drone computers
missile
auto recorece thingy
(I am sure there are a couple more that have passed me bye)

oh and on one of my early games I had a smart bomb that took up an
entire ship, I have never got this again.

I usually complete the game just after I get the missile launcher but have
completed it before I get it a couple of times.

Maybe I sould take my time.

and maybe use the refuel cheet less.

What causes some problems with shortcuts on the falcon, and indeed on tos 2.06 as well is not having a trailing blank on the end of one of the lines in newdesk.inf. If you have ever edited it in Everest that will have stripped the trailing blanks. Edit it again and delete all the lines up to the #K one.

2892. Shareware or not Shareware

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 11:39:41 UTC
From: bd@st-andrews.ac.uk
Message-ID: <3a7i9t$t8@calvin.st-and.ac.uk>
Source record: 177166

Hi.
I've been writing programs for the ST for quite a while now, and I'm
interested to see what Atari users think of the shareware concept now.
What kind of quality and/or support do you expect from a shareware author?
What kind of programs make good shareware titles?
Is it worth producing shareware (i.e. will anybody actually register)?
Which co-ercions (eg. Program function disablements etc.) or incentives
(eg. Free future versions) are best, if any at all?

It'd be interesting for me, as well as other budding shareware authors to
find out more about this, so please, if you have some time, answer the above
questions, and feel free to mention anything else.

Other things I'm interested in are the level of compatablilty required (eg.
across resolutions, older TOS versions and the like), and the value of a
typical shareware registration fee. Also how to deal with overseas regs. etc.

Thanks in advance.

Brian

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
: Are there any PD/Shareware progs which allow:

: Iconify program/window.
Iconify Server, a PD program allows you to do this. You may find this
at HENSA, under:

micros/atari/tos/n/n142/icfs011.lzh

and it's configuration cpx, as:

micros/atari/tos/n/n143/icfs_cpx.zip

MultiTOS and I think MagiC and geneva also support iconification...but
I am not too sure on that.

: Virtual Desktop : a la Sun workstations

Big Screen can do this. You may find this under
micros/atari/tos/m/m110/bigscrn.arc

Another program is monster....which should be available at a.a..u.e.

Hope this helps.

>appreciated

you mean mintnet.tgz I assume? This is a contraction of mintnet.tar.gz and
means it has been archived with tar and then packed with gzip. The unarchivers
you need are on hensa or aaue.

BTW last time I looked on aaue it had gzip packed with zoo and zoo packed with
gzip :)

2899. Jaguar News

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 12:32:26 UTC
From: Jeff.Kovach@f318.n114.z1.fidonet.org
Message-ID: <d73_9411142101@cgs.fidonet.org>
Source record: 177199

PALO ALTO, Calif. (Reuter) - Atari Corp., which last week acknowledged that delays in getting software titles to market hurt the company's third-quarter earnings, said the problem has been rectified and now expects to have about 20 titles out by Christmas.
``It's absolutely not a problem now. You'll see lots and lots of software titles coming out soon,'' President Sam Tramiel told Reuters in an interview at the game maker's headquarters.
Last Tuesday Tramiel said in a statement that Atari will report a loss of about $3.9 million in its third quarter.
That compares with a larger $17.6 million loss in the 1993 quarter. He said the loss in the recent quarter was ``a result of delays in software releases as well as expenses related to promotional activity'' related to the company's Jaguar player.
Atari will soon formally report its quarterly results.
He said Atari, which lost $48.9 million, or 85 cents per share, last year, ``will not have big profits in 1995.''
Asked if he expects the company to return to profits next year after two years of losses, Tramiel said, ``I can't predict when we'll make a profit but we are very close to it already.''
``Our key target is getting Jaguar more established in the marketplace,'' he said. ``We'll be pumping all we can back into marketing and establishing Jaguar.''
With a recent $40 million investment from rival Sega Enterprises Ltd for a 7.4-percent equity stake, on top of Sega's $90 million dollar payment to Atari in a lawsuit settlement, Tramiel said Atari is equipped to succeed.
Time Warner Inc., which is using Jaguar in its forthcoming interactive television trial in Orlando, Fla., owns another 25 percent of Atari. Tramiel said Atari is on track to sell some 200,000 Jaguars on about 30 titles by year-end.
Atari just released ``Alien Vs. Predator'' last month and plans to release five new titles,including the popular ``Doom.''
Analysts say Jaguar, the only 64-bit system on the market, offers better sound, resolution and faster speed than the predominant 16-bit machines made by Nintendo Co. Ltd and Sega, and 3DO Co.'s 32-bit multiplayer.
``But software drives sales -- period,'' said Charles Lemonides, an analyst at Gruntal & Co. ``It doesn't mater how good the hardware is if you don't have good software.''
He said Atari will be clearly in the game if it can roll out 10 to 15 new games quickly and keep titles flowing in.

Yes, It is about a decoder to receive fax press photographs and
pictures from whether satelites with. It receives the pictures in
grayscale
and the software which is to be used with the decoder, only works on Atari
ST High resolution. I do not know if you have the hardware, but the
software seems useless to me when you don't.

The decoder and the software are discussed in a very old article in a dutch magazine called 'ELECTUUR'

I hope this is makes things a little bit clearer.

Bye,

Peter

Source record: 177177

In article <3a7i9t$t8@calvin.st-and.ac.uk>, bd@st-andrews.ac.uk (Brian Duff) writes:
>Hi.
>I've been writing programs for the ST for quite a while now, and I'm
>interested to see what Atari users think of the shareware concept now.
>What kind of quality and/or support do you expect from a shareware author?

I always expect high-quality products for anything I'm expected to pay for, and if the program's not supported, you can bet I won't drop any money into, whether I use it or not.

>What kind of programs make good shareware titles?

All programs make good shareware. In fact, there aren't any stores closer than an hour and a half from me that sell Atari ST software, so nearly all of my software comes from shareware, the rest being used commercial software and freeware. Games, utilities, or anything else.

>Is it worth producing shareware (i.e. will anybody actually register)?

This is the greatest problem with shareware; not many people register. Some simply don't use the software, but some do, and of those a significant percentage don't register for various reasons. I think programs that are mostly successful as shareware usually run under $20US. Of course, even at $5 or $10 there are people who don't register for one reason or another. Releasing software as "demoware," where the program works except for a single key feature (like saving a document, or playing a complete game) is another way to go, which may or may not work better.

>Which co-ercions (eg. Program function disablements etc.) or incentives
>(eg. Free future versions) are best, if any at all?

Probably the most important incentive is to make registering easy. This means accepting cash, checks, money orders (international ones where appropriate), and even credit cards if you can swing it. If your address changes, be sure to release a new version with updated address info, and state in the documentation that the address will not change until a newer version is released. Even toll-free tech support is a good idea (if a bit expensive).

Basically, don't give potential users any excuse to not register.

>Other things I'm interested in are the level of compatablilty required (eg.
>across resolutions, older TOS versions and the like), and the value of a
>typical shareware registration fee. Also how to deal with overseas regs. etc.

Compatibility is an important issue. If at all possible, make sure that your programs work on all machines (512kb to 24Mb RAM), will run off hard drives (but don't have to), will run in all resolutions (ST Low through Falcon True Color and beyond), under all OSes (TOS 1.00 - 4, Geneva, and MagiC!), and on all processors (the entire 68000 line of chips).

Basically, make your program as machine-independent as possible. Some programs don't lend themselves to all of these conditions; games run faster when written for a specific configuration, using low-level system calls; word processors usually don't support ST Low, since it doesn't really have enough pixels; and some programs require more than 512kb.

Wherever possible in a program, stick to standard library functions (disk I/O and the like), use the AES for the user interface, and use the VDI when necessary. For faster programs, lower-level routines are a must (like using Line-A calls instead of VDI), but that can also reduce the compatibility of your programs.

Regards,
Tom

Er, yes, it works fine under my Neodesk versions (both 3.01 and 3.03).
It also works great under MagiCDesk, Gemini 1.2 and 1.99, and all the others.

Maybe your copy has got corrupted, or it's clashing with an auto folder
program or something.

Wait until the main screen appears, hold down CAPSLOCK, and type MONEY.
Your account will increase by 10,000. If this is done too many times, either
the game will crash or an earthquake will occur.

I have not tried this cheat (I don't own the game). It appeared in an
ST Action magazine. Good luck!

Record-breaking pi calculations on Atari equipment were all the rage on
this newsgroup about two years ago or so. I believe the gentleman above
got a bunch of interneter's involved in the contest, which was pretty cool.
I think the winning program for that time period was uploaded
to atari.archive.umich.edu.

: Could somebody give me a hint how to set the color palettes of
: a Falcon? I use PureC and want a 256 colors greyscale...

: Many thanky in advance,

: Christian

On the Falcon you can choose from 200,000+ colors. This is 18bit. 6bits
are used for each color, so you have only 64 shades of grey possible.
This is a good greyscale. However if you want more you can "add" a
little color to the pallete to 'simulate' in-between greys. Like
1R-1G-1B, 1R-1G-2B, 1R-2G-2B, 2R-2G-2B ... If you notice only 1-1-1 and
2-2-2 are true greys. :)

XBIOS 93 (VsetRGB) WORD index, WORD count, LONG *array

This call grabs a block of colors at "array," for "count" number of times,
starting at "index"

You want to have an X windows server to get X windows output on your Atari
(from programs running somewhere remotely on a real computer). Something
like MacX for the Mac (just better -- hopefully :-). E.g. you could run
XMosaic on a Unix box but view the XMosaic window on your Atari.

|[... massive parts of post removed...] I must admit, though, that my
|posting was a little bit too emotional, but this is due to John Townsend,
|who has worked for Atari before and who carries thus also a responsibility
|for the misery at Atari concerning computers.

Alfred.. excuse me. I was not in a position of authority at Atari. I fought with the people who controlled Atari's decision making process on quite a few occasions. I did everything I could to make the platform better for the average Atari user. That is because I was an Atari user first, an Atari employee second. My first computer was an Atari 400 (in 1982) and I had been faithful to the Atari computer line since that point.

I am NOT responsible for Atari's lack of marketing or development. I did what I could and I think you should think before you type from this point on. How can you use the logic that "Person A worked for Company B, therefore he is responsible for the position that Company A is in." That's garbage and it tries to oversimplify the situation.

|As for the success of operating systems, I do not think that any of us can
|really say, which one will be the standard for the future. But I think, as
|John Townsend has worked for Atari, it is time that we should talk about

Yes, I did write that post. And no I didn't "slag" my previous employer.
I didn't say anything bad about Atari. I simply said that Atari's computer
products are a thing of the past. I don't think Atari will be producing
computers any longer.

Think about this for a moment.. Look at Atari's actions. It hasn't done
anything with computer products for well over a year. It has told its
customers that is is concentrating all of its efforts on Video Game
products. Do you honestly think that Atari can drop from the highly
competitive computer market for a year, return to it, and actually
compete? If they can, then they are an amazing company that I
have underestimated.

I still like Atari. I like the company. I think Jaguar is a great product.
I just hate to see people get their hopes up for the "Falcon060" or
something like that. I don't think it will happen.

h9250467@idefix.wu-wien.ac.at (Alfred Radauer) wrote:
|Is this supposed to say anything? John Townsend worked as a systems
|programmer for Atari and I am wondering how a person can work for such a
|long time and produce so little.

You don't know anything about what I did at Atari. How dare you attempt to accuse me of "sitting on my hands" during my time at Atari. Atari had a small staff of systems programmers (their choice, not ours) and we did pretty good considering the constaints we worked with.

|Is it clear to you, that those people
|never went beyond a control panel and a simple graohics shell while they
|were being paid by Atari? They even had to buy the kernel of the
|multitasking system from a person programming in his freetime, they never
|were able to hold deadlines and they even were not able to produce some
|kind of documentation.

I was responsible for a number of things including pieces of the new Control Panel. But, you consider that small potatoes eh? Well, I think if you ask around on the net and in the Atari community, I think you will find that many people like it.

As for the multitasking system, when Atari started to investigate adding multitasking
support to TOS, they looked at what it would take and also looked at what solutions already existed. MiNT looked to be a pretty good solution and so we made a deal to get it. Why should Atari recreate what has already been done? As for deadlines and documentation, we did produce documentation. And you show me you announced deadline that Atari's systems software group didn't meet and I will call you a liar to your face.

|If you say, they played with more computers than we
|had dinners, I am taking it word by word. I even can imagine John playing
|Doom on his PC during working hours at Taligent.

Oh, this is good. You don't even know me and you are questioning my work ethic? How dare you! Who the hell do you think you are? I work very hard at Taligent and Taligent has nothing to do with this discussion. I appreciate your effort to sidetrack my comments into a personal issue, but you can just forget it. I am not going to fall for it.

|BTW, did you also notice
|that Taligent are far from being on schedule with their operating system?
|That people evem did not see anything from Taligent except announcements
|on low level routines?

Taligent is far from being on schedule? That's funny.. the dates that I have seen in press releases can that Taligent plans to ship something during (and I quote) "the mid 90s." How can we be behind schedule? Anyway, I do not plan to comment on Taligent release plans or products, so you can continue to bait me, but I will ignore anything on this subject from this point on.

|To consider him an expert or a professional and
|thus giving more weight to his statements is only possible if he can show
|references. And a control panel anda TOS 2.06 desktop hardly qualifies
|John as such an expert, consiedering the time it took to develop those
|"powerful" tools, and his work at Taligent is far frombeing visible to the
|public. I stated all the above critics into an open letter to John, let us
|see if he hast guts enough to answer it and give an account on what he did
|at Atari.

And what have you done for the Atari community? What gives you the right to question my "professionalism?" Let's just put it this way.. I did enough interesting work at Atari that I was able to get myself a position at Taligent. And I don't have to answer to you or anyone else. So, if you don't like me or what I have done, that's too bad for you. Frankly, I don't give a damn.

|Hi John!
|
|Ihave been reading with interest your comments on Atari computers,
|especially the one where you critisised that TOS would not stand up to its
|competitors, in terms of features, networking etc.... I got an old German
|Atari newspaper here that states that a certain, high rankingAtari person,
|a system programmer for Atari, namely John Townsend, has quitted Atari for
|Taligent software. If you are not that person and anything inthat last
|sentence is wrong, I will by all means excuse myself and ask for apologies.
|But if you are that person (which I think is highly probable), then I am
|little bit puzzled.

Yes, that is me. I left Atari to join Taligent in March of 1993. I was at
Atari from September 1987 to March of 1993. I did everything from
Technical Support for Atari products to COMDEX shows to system
builds to development on pieces of TOS.

|
|I mean, if someone is haveing a job at a company, he has to stand up
|usually in the morning, get to work at around 8,9,10 am and stay till in
|the afternoon. I assume you also did this, I also assume that you got paid
|for doing work for quite a period of time at Atari. Now, on the other
|hand, I am looking at TOS/GEM, which is a work mainly done by DR and the
|things Atari did with it. Now, during the period you worked at Atari, the
|things the system programmers did, were:
|some bugfixes and adaptations to STE and TT
|TOS2.06 desktop
|modular control panel

I worked on lots of things. The Atari eXtensible Control Panel, a number of
control panel modules, the SetMode() video driver stuff for the Falcon030,
more testing code that you can possibly imagine, and lots of other things
that I cannot and will not discuss with you.

|Considering what other programmers did during the same time, I kindly ask:
|WHAT DID YOU DO AT ATARI ALL THE TIME?
I certainly didn't flame people on the net about their work, thats for sure.

|drinking coffee? playing games? I think the amount of work you did at
|Atari gets you a pure "F" , a 5% score at most. If you critizise Atari TOS
|(which, BTW and to your knowledge of Atari computers has nothing to do
|with "Magic or so") , then you are ciritizising your own work.

No, I am saying that TOS hasn't managed to live up with the rest of the world when it comes to features in the operating system. And I challenge you to prove that it has. It doesn't have networking software built-in, it doesn't have online help, it has a very basic graphics system, it doesn't have email support available. There are so many things that the Mac and PC can do that TOS can't that it makes it really hard for TOS to compete with these operating systems.

In a way, yes.. I guess I am critical of my own work. The way I look at it is that I am critical of the history of TOS. Yes, I was a part of that history. No, I didn't have any decision making abilities during that history. I had little or no input into what direction TOS went. It was decided at higher levels than the system programmers group.

|One of
|Ataris biggest mistake was not to fire people like you (there are still
|some left.....) earlier, people , who do nothing, consume money, much
|erlier.

Oh that's rich. You don't even know my (except that you read my name in STReport) and you are saying that Atari should have fired me? I bet I can find people right here on this newsgroup that will disagree with you. You are entitled to your opinion, even if its wrong. I worked very hard for Atari and I did what I was told to do. If you don't like that, then that's your problem.

|It is a shame, that a company as Atari has to, because you were
|incapable, buy tghe kernel for the operating system from someone else, who
|programmed in his freetime. What was your commitment to the Atari system
|software? Now let us assume, youare far from being a decent programmer:
|Why did you not at least document existing OS functions? Why no support?

I was no responsible for documenting Atari's OS functions. Atari told the system programmers group that there were people taking care of this. In addition, Atari had a full-time member of the team that was responsible for documenting our work. I cannot and will not be blamed for something I didn't have control over. And I did support people. I supported them more than you can possibly comprehend. I did support on GEnie, CIS, Delphi, BIX, email, Mail, the net.. you name it.. I was there. In fact, for a great part of my time at Atari.. I was the ONLY one who was there. So, don't talk to me about support. I have done more for Atari users in that area that you could ever even think of doing.

|Now, after you quit Atari, you appear in discussion groups, now, when
|nobody actually needs you and your comments.

I have just as much right as you do to post my opinions and comments in this forum.

|It also puts a bad light on Taligent, if they hire you. It is quite a
|time, when i had a discussion with a person, who dows not like Atari (and
|his arguments are objective) about futuere operating systems and he was
|shocked to hear, that programmers from Atari were working on Taligent. I
|suppose you atari newsgrouop activities take place during your freetime

|and not during working hours at Taligent, don't they?

I work long hard hours at Taligent (I just finished a major untaking that rquired me to work for 2 months straight without a day off.. that's not my record.. the record was the Falcon030.. I spent an entire summer working 12, 14, round the clock days to get the Falcon030 out the door.)

Not to mention that my posts clear say that I do not speak for Taligent. If you are foolish to base your opinion of Taligent on my comments about TOS and Atari's computer products, then I feel sorry for you.

Using your logic, Atari didn't have good people. Atari had really good engineers. They didn't have enough of them though. Take a look at Apple. They have hundreds of engineers working on System 7 and System 8. Microsoft has hundreds working on Chicago. Atari can't compete with that. They only have a hand full of people and no matter how good they are, they can't compete with work that Apple and Microsoft can produce. There just aren't enough hours in the day.

|Now, as Taligent is
|far from being finished and far beyond schedule, and I even can guess the
|reason (Townsend and Co.) I will glady buy Microsoft shares, because
|whatever you are doing there at Taligent, if you are working the same way
|as with Atari, it cannot be of acceptable quality.

This comment doesn't even deserve a reply. You are nothing more than a person looking to bait me into an argument about something you know nothing about.

|Sincerely yours,
yeah, right.

--
-- John Townsend "I want something, I just don't
Taligent, Inc. know what it is!"

Disclaimer: I don't speak for Taligent, I speak for myself.

2929. F/S: *** COMPUTE! Back Issues... CHEAP!!! ***

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 18:41:29 UTC
From: kwwong@lynx.dac.neu.edu
Message-ID: <3a8b0p$19i@chaos.dac.neu.edu>
Source record: 177197

These are the back issues of COMPUTE! magazines prior to when the publication went all-software-review-only. Each back issue has great type in programs for all sorts of computers including IBM, Apple, Commodore, Amiga, and Atari. I'd buy these BECAUSE OF THE GAMES!!! :-)

December 1985: SPEEDSCRIPT revisited; enhancements to SpeedScript 3.0 ... BALLOON CRAZY, exciting arcade game for Commodore 64/128, Atari, Apple, IBM PC/PCjr, TI ... Atari Fine Scrolling - secrets of advanced Atari graphics ... Commodore 128 Video - design your own custom characters ... Million Color Palette for PC & PCjr - create extra colors without extra hardware ... Apple Disk Booster - increase disk capacity with this short program. (Asking price: $3)

March 1986: SWITCHBOX - electric pachinko game for Commodore 64, 128, Amiga, Atari, Atari ST, Apple, and IBM PC/PCjr ... MULTIMEMORY for 64 and Apple - load several BASIC programs at once ... Atari Bootstuffer - fit 10 Boot programs on a single disk! ... IBM Fractal Graphics - fascinating images with a new math ... BASIC Sound On the Atari ST - how to make music and sound effects ... Requester Windows in Amiga BASIC - add professional features to your own programs. (Asking price: $3)

April 1986: New Technologies: The Converging Digital Universe - why everything from Computers and CD-ROMs to TVs & Satellites are on a collision Course (articel) ... Adding Power to ST BASIC - valuable techniques for Atari programmers ... Apple Hi-Res Graphics - mix, flip, and copy high-resolution screens ... 64 Screen Genie - A magic method for character graphics ... AmigaDOS Batch Files - take control of your Amiga ... Atari FontMaker - design your own custom characters. (Asking price: $3)

May 1986: HICKORY, DICKORY, DOCK - and educational game for Commodore 64 and 128, Atari, Apple, Atari ST, Amiga, and IBM PC/PCjr ... Managing Files From Atari ST BASIC - a major book excerpt ... Better Branching In AppleSoft - computed GOTO and GOSUB ... 64 Autobooter - make disk programs run automatically ... Atari DEBUT - add commands to BASIC for easy debugging ... MODified Shapes for IBM ... Amiga Puzzle - learn new Amiga BASIC progamming techniques. (Asking price: $3)

December 1986: LASER STRIKE - a challenging one- or two-player stategy game for Apple, Amiga, Atari, Commodore 64, IBM PC/PCjr, and ST ... Mail Merge And Word Count - two productivity tools for Commodore 64 Speedscript ... APple Math Graphics - dazzling screen displays with one program line ... Fontier 128 - a comprehensive 80-column character editor for the Commodore 128 ... Atari DOS Switcher - an instant DOS

menu whenever you need it. (Asking price: $3)

January 1987: CHAIN REACTION - an explosive strategy game for Amiga, Apple, Atari, Commodore 64, IBM PC/PCjr, and ST ... FastKey For The Commodore 64 - entire lines of BASIC with only a few keystrokes ... Printer Master For Apple - easily access and cutomize all your printer's features ... Disk Fix And Quick Screen - two handy utilities for IBM PC/PCjr ... ML Write For Atari - convert machine language into DATA statements ... XMODEM File Transfer for Commodore 128 And 64 ... Apple DOS 3.3 Wildcards ... Music Maker 64. (Asking price: $3)

February 1987: WARI - a challenging, ancient AFrican strategy game for the Amiga, Apple, Atari, IBM PC/PCjr, Commodore 64, and ST ...File Compressor For The 64 - crunch files for faster transfers and more disk space ... Well-Behaved Batch Files - more flexible, interactive batch processing for IBM PC/PCjr and compatibles ... Amiga Jigsaw - An absorbing graphics puzzle ... 64 Label Master - custom hi-res graphics for printer labels ... Quick ProDOS Catalog for Apple II ... Full-Screen Shell Sort For ST BASIC ... Atari SpeedScript Customizer. (Asking price: $3)

March 1987: EUCHRE - an absorbing version of the popular card game for Commodore 64, Amiga, Apple, II, PC/PCjr, and Atari ... Applecoder - hide your private files from prying eyes ... Filedump For IBM PC/PCjr - examine your disk files in detail ... Custom Characters For Atari XL and XE - an efficient way to make your own character sets ... DOS Calc For The 64 - work with your disks the easy way ... 3-D Surfaces For Amiga - create 3-D shapes in any color combination ... Diskcheck - Powerful Apple sector editor for DOS 3.3 ... 128 File Viewer - a fast, multipurpose disk utility. (Asking price: $3)

April 1987: SPEEDSCRIPT 80 - our powerful, full-featured 80-column word processor now for Apple IIe, IIc, and IIgs ... MENU PLANNER - plan meals effectively with this easy-to-use program for the Commodore 64, IBM PC/PCjr, Apple, ST, Amiga, and Atari ... MAGAZINE INDEXER - A specialized database for the IBM PC/PCjr, Atari ST, and Apple ... Hyperscan - stunning, high-speed graphics for the Commodore 64 ... Disk COMpacker For IBM PC/PCjr - conserve disk space and simplify directories ... Easy BASIC Autoboot For Atari ... Amiga Fonts - slect system fonts and text styles under program control from BASIC ... Merge 128. (Asking price: $3)

July 1987: WEATHER WIZARD - a forecaster for IBM PC/PCjr and compatibles, Commodore 64, Amiga, Atari ST, Apple II, Atari 400/800/XL/XE ... PFkey 64 - add powerful BASIC 7.0 commands and functions to the 64 ... P/M Magic For Atari - complete control over arcade-quality graphics and animation ... IBM Printer Control - customize printer control codes easily from DOS ... Sprite Designer - an easy-to-use, full-featured sprite editor for Commodore 64 ... Converter - Apple graphics conversion utility for Print Ship ... Medium-Resolution Autorun For Atari ST ... DIsk Expander For Apple II. (Asking price: $3)

November 1987: THE HERMIT - explore a mysterious underground world in this exciting text adventure for the Commodore 64, IBM PC/PCjr, Apple II series, Amiga, and Atari ... IBM Directory Menu - load, run, rename, or delte files at the touch of a key ... Dynamic Graphics For The 64 - Lightning-fast hi-res graphics from BASIC ... Chrome II - powerful double hi-res commpands for Applesoft. (Asking price: $3)

I strongly recommend all these issues if you are on a tight budget. :-)

NOTE: I will pay shipping if you buy ALL 11 back issues at $33!!! (Well worth the price with all the programs you can have here)

E-mail me if you are interested.

-Kwong

From: wells_s@ix.wcc.govt.nz
Message-ID: <3a8d95$543@golem.wcc.govt.nz>
Source record: 177102

] He is desparate to know the cheat codes, especially for getting more
] money, can someone please let us know.

Hold down shift and type:

MONEY
FUNDS
or
CASH

Doing it 10 or more times will result in an earthquake. Every time you
do this you get $10,000. Doing this too much _can_ cause the game to
crash.

2931. Re: TWO IN ONE AND NEODESK 3

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 19:21:14 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3a8dba$543@golem.wcc.govt.nz>
Source record: 177103

] I just downloaded TWOINONE a GEM-shell for archivers.
] It just doesn't work under NEODESK3, anyone has tried ?

I don't know about the latest version, but the one I tried a couple
of months back didn't work under Neodesk 3.

With Neodesk 4, I don't need a shell! I just double click on whatever
I want to archive/dearchive, and it does it!

2932. Re: Dextrous Development - Assistance needed.

Message-ID: <3a8dgk$543@golem.wcc.govt.nz>
Source record: 177104

] When is it due out? It really does sound too good to be true.

And how much is it gonna cost.... (Of course, if it _is_ Falcon only,
it's not my problem :)

2933. Re: Turning off MTOS

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 19:25:38 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3a8dji$543@golem.wcc.govt.nz>
Source record: 177105

] I thought that MiNT and MultiTOS had to run at the same time?
]
]
] If it does offer any benefits how can it be done?

MiNT is the multitasking piece of Multi-TOS (hence the slow speed),
it is possible to run it in a single-tasking mode apparently, but if
you're using TOS 2.xx or better, I can't imagine wanting to bother,
as there's not a great deal of benefit.

2934. Re: Shareware or not Shareware

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 19:36:29 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3a8e7t$543@golem.wcc.govt.nz>
Source record: 177106

] Other things I'm interested in are the level of compatablilty required (eg.
] across resolutions, older TOS versions and the like), and the value of a
] typical shareware registration fee. Also how to deal with overseas regs. et

Most authors lately seem to write PD software, and then just in case
someone might feel like paying, call it Shareware, and slap a fee on
it to get the faster version, or whatever.

This isn't a big problem, but when they charge $20+ for tiny little changes,
this is a big-time ripoff. Jeff Minter charged 5 pounds ($7) for
Llamatron, and made tens of thousands of pounds out of it, which goes
to show, that the more affordable something is, the more people will
pay. If someone charges $5 for something, rather than $20, they'll
get more than 4x the amount of people paying - assuming what they pay
for is deemed worthwhile.

I've paid for several shareware programs, all of which have had support
dropped for them a few weeks after I paid my money, which REALLY annoyed
me. (With the exception of "Antidote" which the author says only had
around a dozen registrations for. The Virus-Killing part of it is
far superior to the much more expensive UVK).

I'd be far less annoyed if the amount I'd forked out hadn't been as much.

To handle overseas registrations, work out what it'll cost you to post
the item to the other side of the planet, and slap that extra cost
onto the fee. That's what most people seem to do, which is reasonably
fair.

There's nothing wrong with shareware, as long as the buyer gets
their moneys worth, and some form of support for at least a few months.

So no charging $25 just to be able to save more than once, or to get
rid of a 30-day limit, or an annoying 10-second pause intro screen,
it's far too much!

2935. Re: Wanted: GEM Enhancements

Newsgroup: comp.sys.atari.st
Date: 1994-11-14 19:38:59 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3a8ecj$543@golem.wcc.govt.nz>
Source record: 177107

] MultiTOS and I think MagiC and geneva also support iconification...but
] I am not too sure on that.

Neither Magic v2.x or Geneva v1.x supports iconification.

] : Virtual Desktop : a la Sun workstations
]
] Big Screen can do this. You may find this under
] micros/atari/tos/m/m110/bigscrn.arc
]
] Another program is monster....which should be available at a.a..u.e.

The best one I've found so far is "stretcher" which is an STE version
of big-screen. I found it on atari.archive.umich.edu in
atari/Graphics/stretcher.lzh (lzh or zip, I forget which...)

Lets you have a virtual screen as large as can fit in RAM. (e.g.,
anything from 320*200 to over 1200*1200!)

Hi folx!

I need an *English/US* TOS 2.06 as an *image* file *pretty urgently*!
Any good Samaritans out there that can help me out?

I'd appreciate it if you could email me first at the address below
to avoid multiple files being sent.

Thanks muchly!

And to answer the two questions which will undaubtedly come up:
- Yes, I am a registered developer and...
- No, Atari doesn't care anymore...

David Anderson (lando5@iii1.iii.net) wrote:

: I remember John well from the days when I frequented (you'll pardon the
: expression) GEnie. Aside from being a member of the TOS Development
: Group, he was perhaps Atari's single most visible online representative
: and all-around cheerleader.

: The simple fact of the matter is that Atari has NOT been breaking gorund
: in the areas of connectivity, expansion, etc., on either a hardware or OS
: level...and frankly, they've been playing a pretty darn pitiful game of
: follow-the-leader, when it comes to those points. Atari has not been
: keeping up with industry developments; it's the truth, and sometimes it
: hurts. If you choose not to accept that, it's up to you, but let's not
: kill the messenger here, eh?

What I don't understand is why Townsend cares if Atari users continue to use their Ataris. I have no doubt they are garage sale material. BUT I CAN'T AFFORD A NEW COMPUTER! Get it? Therefore until Mr. Townsend buys me a clone, I'm going to continue to try to make the most of my ST. Being "realistic" about Atari corp. isn't going to help me be any more productive with my ST, which is my only computer. Take this as opinion only, but I wish John would keep his preaching out of this newsgroup. If he posts another message like that last one, he earns a place in my killfile.

God, I hate it when X-Atarian's think their doing you a favor by telling you your computer is crap.

Hello... I have the following system that I will be entertaining offers
for... it is an awesome system for the right buyer!
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
1.44 meg internal floppy
TEN megs ST ram; repeat here... that is TEN,
SIXTEEN megs TT ram... that's SIXTEEN megs TT ram
(26 megs ram combined total)
TTM194 19 inch monochrome (perhaps available seperately)
PTC1426 TT color monitor (also perhaps available seperately)
8 bit color video card (coco)
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.

This is designed as a professional publishing and image retouching
system... the system was designed for the DIDOT/RETOUCHE suite of
programs which are not included, but easily acquired from various sources.
OF COURSE the system is completely exactly totally compatible with
other Atari software since it is a genuine Atari TT motherboard
mounted in the tower case.
Please direct offers, inquiries and replies to:

|What I don't understand is why Townsend cares if Atari users continue to
|use their Ataris. I have no doubt they are garage sale material.
|BUT I CAN'T AFFORD A NEW COMPUTER! Get it? Therefore until Mr.
|Townsend buys me a clone, I'm going to continue to try to make the most
|of my ST. Being "realistic" about Atari corp. isn't going to help me be
|any more productive with my ST, which is my only computer. Take this as
|opinion only, but I wish John would keep his preaching out of
|this newsgroup. If he posts another message like that last one, he
|earns a place in my killfile.

I wasn't preaching.. I was expressing my opinion. I believe that Ataris are fine machines. Continue to use them if they appeal to you! However, don't expect Atari to continue to improve the line. I don't think they will. (The good news for Atarians is that it looks like a number of capable German groups are picking up the ball and running with it.) I hope I won't end up in your kill file, but if I do for stating my opinion.. oh well.

|God, I hate it when X-Atarian's think their doing you a favor by telling
|you your computer is crap.

I didn't say it was crap. Far from it in fact. I think the Atari is an excellent home computer. The only problem I have with it is that its software isn't up to the current state in the industry. If you don't need this, then keep using Atari computers. But, don't expect Atari to release the Falcon060 or some PowerPC based computer, because I don't think it will ever happen.

: hurts. If you choose not to accept that, it's up to you, but let's not
: kill the messenger here, eh?

: "People who live in glass houses...might as well answer the door."
: --Solomon Short
Let me make sth. clear. I do not think that Ataris technology in either
hardware or softwareplatform IS uptodate when it comes to the
computerline. I think that a 68030 MHz machine is pretty outdated on the
hardwareside, although the DSP makes it usable for harddisk recording. I
do not know of any other computer Atari currently produces. I also know
that TOS is outdated. My comments did not refer to Atari products, but to
products from other companies. If we talk about TOS and Magic we are
talking about completely different things, as Magic is not an Atari
product. Additionally, Magic is actively supported, new versions demonstrate
that Magic (which is TOS compatible)
is NOT out of date. Its features and handling make it, especially with
regard to version 3, very much superior to Windows and System 7 in many
areas (just take preemptive Multitasking) while still operating at
excellent speed and using systemressources very well. We even do not need
Atarihardware, as the operating system will support Macintoshes.
However, if I look what Atari achieved in developing system software, how
hard it was to get TOS 1.4 into release, to get MultiTOS in release, where
most of the work BTW was done outside Atari, how hard it was to get Speedo
GDOS in release, then the updtae to Speedo 4.2; and now take, as a
comparison, the speed at which other programmers released system software.
Take Compo, who have managed to get Speedo 5 out in MUUUUCCCHHH shorter
time, with really improved functionality. Updates are very fast available,
documentation is also. The same is true for Magic, NVDI and the likes.
Now we have John Townsend
1) His comments about the ST and TOS are true; but he shows very little
knowledge of the Atari market and even less respect for the prgrammers
working in it, if he, for example, sets TOS equal to Magic ("Yeah, Tos or

Magic how it is called"). TOS is sth. he was responsible for, and it is - as he himself stated - not uptodate. The statement which he was implying, "Magic is out of date" is absolutely NOT true....I do not know how much I need to stress that, again, MAGIC IS NOT EQUAL TO ATARI TOS.
2) My open letter or my criticism towards John Townsend was in the following line not so much about the statement he made himself, but a question on what he did, as a responsible to the systems software, at Atari, what his working days looked like, what his projects and achievements were etc...
We both agree that Atari has lost out on hardware and on the OS software. I wanted to ask so. who worked for Atari, how this could have happened. Why was TOS development so slow? Why were bug reports etc. simply unanswered? If Atari people critizise the upper managment for that, do you really believe that Sam Tramiel came personally to throw FAX papers away and say "we pay you, but we do not want you to touch the sources to TOS"? I don't.
3) In summing up the points above I think it is very reasonable to critizise John and ask for a statement on his side. Maybe he could tell us a little about the insides of Atari computerdevelopment over the past years. But I do not like unqualified statements about the honest work others do, that IMHO should have been done by him and many other programmers at Atari.

Till then,

Alfred

>Why not? If a program is no longer supported, and has therefore been overtaken
>by the competition (as Calligrapher had by Papyrus, TW3 etc) why not put it
>ona cover disc?

Well, for the simple reason that it was only a couple of years ago that
the program sold for over $200. And now, someone is putting it on a
mag cover disk? I understand that it doesn't contain all of the modules
nor the manual, etc., so it sounds like the end user will have to pay
almost full price to get the same as I did. Still, I don't like the
idea of any commercial program being made "public" in this fashion. It
just doesn't "sit right" with me.

2957. Hard Disk Utilities

Newsgroup: comp.sys.atari.st
Date: 1994-11-15 03:03:06 UTC
From: vsnyder@math.jpl.nasa.gov
Message-ID: <3a98da$pru@netline-fddi.jpl.nasa.gov>
Source record: 177122

I've looked at a few archives for utilities to low-level-format a hard disk, and allow the user to provide a defect list. If you've got a defect in a boot sector, or FAT, or root directory, scanning _after_ formatting and partitioning doesn't do any good. Also, the manufacturers identify more marginal errors that may become transient problems. Ideally, HD format utilities also should use the SCSI "read capacity" command, instead of asking me for cylinder/head/sector information.

I have version 2.61 of Supra HD utilities. The button that claims to make the HD bootable doesn't. The button that maps out errors by writing and reading all sectors bombs at the end, and then one discovers that no matter what partition you checked, the C: partition is trashed.

Does anybody have a newer (that is, a _properly_functional_) version of Supra HD utilities, or care to recommend an equivalent (preferably free)?

Thanks in advance.

E-mail, please, and I'll summarize if there's interest (and answers).

Mickey Boyd (boyd@gauss.math.fsu.edu) wrote:
....cut some text....

: You are absolutely correct, but your hardware has the option of not segmenting
: memory at all. Unfortunately, MSDOS won't let you take advantage of it!
: Windows will, but that does little to stave the agony of having to work with
: that awful environment.

Unfortunately, to get a decent accounting-software in swedish for the PC
today, you have little choice but to stick with MS-Dos...

: Again correct. However, the IRQ stuff is quite easy to set up IF you have
: some decent diagnostic software. As you point out, the software is what
: failed you. The hardware flexibility one has with PCs is worth a bit of
: bother, though there is no excuse for not including a decent diag package
: with MSDOS to make it something other than black magic (then again, my
: "chief sorceror" position is fairly safe :-).

:-)
I ended up configuring my neighbour's laptop, and teaching him the
"finer" points of MS-Dos and Windows. And he's not stupid, he works with
the latest stuff in tele-com excange stations and such things.

: > Then I had trouble with the conner 250 tapestreamer, called the swedish
: > support, got my self a real PC-lamer that suggested that I would get new
: > hardware, told him to f*ck off, got a pirated copy of conner backup exec
: > and it worked like a charm. (Conner backup exec is the streamer soft that
: > you have to buy, Conner backup basic comes with the drive)
: Again, software.

You got that right, the support didn't even get me a decent config-file
for the backup-soft, or even tell me how to make one on my own.
(The documentation of the hardware/software of the streamer was really
bad, all it said was "this is how you connect the streamer, now it works,
congratulations for buying a state of the art streamer!" or something
similar.

: To clarify, the hardware has great POTENTIAL to suck, based on what base
: OS is used. The MSDOS/Windows OS environments do suck, no potential about
: it. After having dinked with several fast LINUX systems, I can say that
: these are quite cool (given that one is a UNIX person). I have heard that
: OS/9 is much nicer than MSDOS (a statement that might be saying very
: little :-). PC hardware can be really neat when the MSDOS/Windows shackles
: are discarded. Of course, then one is something of an "outsider" (gee, does
: that sound familiar to Atari owners....).

What isn't nicer than MS-Dos?

: Don't get me wrong, I'm not beating the PC drum or anything. I guess my
: point is that software is everything, and that MSDOS/Windows is the real
: problem with most PCs IMHO, and the consumer computer market in general. I
: stick with my Atari systems because the software is cool/fun, not (obviously)
: because I demand extreme performance. Mac people will understand this as
: well, as Macs were notoriously slow for many years compared to PCs (Mac
: zealots didn't care, and mostly still don't, as the software is soooo nice
: in so many ways when compared to the PC platform).

PC has got it's advantages, I'll be the first to admit that.

: Heck, be happy that you are an Atari enthusist. You have experienced a
: computer system that is truly easy and fun to work and play with. That is
: what still draws me to them, even though I am surrounded by various "hot"
: boxes. If the realities of your situation require that you have a
: "mainstream" platform lying around, buy a bigger desk and set them both up
: (best kind of multitasking). Atari stuff can be amazingly competant and
: useful for many "serious" things as well, though to a degree this will
: probably fade with time. There is some great stuff out there, and it is
: mostly dirt cheap nowadays.

I cut a lot of text in this one! :)

I'm not as negative to the PC as I've led you folks to believe, you got
so irritated on the stupidity of the machine!

Regards, Tommy

William Wong (wongck@lobby.ti.com) wrote:
: If you use an ATARI, I don't see why it takes you 3 days to learn how to use
: Windows. Most stuff are similar, click and drag etc. Infact, the program
: groups are great idea, having stuff that do the same thing together, otherwise
: the new Neodesk would not have followed them, right?

: I think the transition to use Windows is less than 2 hours as GEM really
: prepares you for it. It did for me, for that matter I can use X-windows
: without any help the first time.

I didn't say I had any problem using the machine.
Maybe you and I have different standards of doing things, I don't quit
until I honestly believe that I have optimized the system to the fullest,
and then some more...
The default-settings of any of MicroSoft's products are hardly the
optimum for any computer, just the setting that works with most computers.
Ofcourse I got the system up and running in less than an hour, but I
don't believe in using default-values when I can use other values that
use my machine to the fullest.
I have several different boot-choices at boot-up, to be able to use the
machine to the fullest in any program I intend to use.
I have optimised the memory far better than MS-Dos's memmaker, which
really wasn't very hard to do, the hard bit was to do it better than that.

: Installation of DOS and windows is a breeze. They have auto install program
: that will do it for you in less than an hour. In fact most software that I
: have installed can be done in less than an hour.

Again, the default-settings are not the best settings.

: >The hardware:
: >486DX2/66, SCSI-2 Fast 1 gig hdd, SCSI-2 CD-rom, SVGA 1mb, 16mb memory,
: >conner 250 tapebackup, SB 16 etc. (he let me decide what to get. :)

: You're lucky to start off with a fast PC, I started off with a 286.

Well, I could have gotten him a cheaper machine, but a computer should be
easy, fast and fun to use.

: >What I have learned during these 3 days, is that the PC is a very stupid
: >design. Have you ever tried to optimise the conventional memory?

: Nowadays, software are a whole lot better, some knows how to use EMS so that
: there is near to 0K usage of conventional memory. It is just afew option setup
: on the software.

Yes, I do have other software than MS-Dos that even optimized the memory
better than I did, but then some soft's wouldn't work.
I used memmaker at first, and as I stated above, it wasn't very hard to
optimize the memory better than memmaker.

: It is the software that you're using that is really the problem. Get and use
: smart software.

I know that most of my problems depends on bad software, and poor advice
from my PC-friends.

: Now this is a area that is normally a nightmare to most ppl. Read the manual!
: and use a good diagnostic problem to find out what is used and what is not.
: Also try using the newest DOS, they allow you to skip loading device drivers
: at boot time, so you can boot up bare without any drivers.

Got the latest DOS, and there are better solutions than spending time
skipping drivers at bootup. I did read the manual.

: I must say that this is a problem caused by to much support for the machine.
: There are so many HW products upgrades for the machine while the machine have
: limited available IRQs/BIOS addr for them all. I wish that my MSTE have all
: these HW upgrades, so that I am not stuck at standard 4 colours for med res or
: just 4 Meg RAM. Also with so many HW product available, there is alot of
: competition and it drives the prices down.

As far as the problem with the Conner backup system is concerned, it was
merely very bad software, and very bad documentation.
Hard to make anything work under such conditions.

: I am not blowing the trumpet for PCs. Come off it, I don't believe that
: millions of people are wrong by chosing PCs rather than Atari, Amiga or Apple
: machines. Remember back in the late 70s and early 80s there were tons of other
: make of machines (Dragon, Brain, Speccy, ZX 80/81, QL etc) that have all gone
: down the drain. In this market it is the survival of the fittest and PC looks
: like it is and will be breaking into the workstation market in the very near
: future.

People don't choose a computer from the spec's, the choose a computer for
the software, why do you think I told my father to get a PC for his
accounting?

2961. seeking Carlos Varela (German-to_English)

Newsgroup: comp.sys.atari.st
Date: 1994-11-15 06:19:12 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <JA+UspI.johnhechtman@delphi.com>
Source record: 177134

I'm looking for an email address for Carlos Varela (the author of the shareware program German-to-English). About a month ago I sent a s/w payment to the snailmail address listed for him in Canada, as of yet the letter has not been returned and I've not received a registered version of the program.

To make matters worse, I was foolish enough to send him an International Money Order rather than a personal check. I thought I''d make matters easier for him, since I'm a US resident and he's Canadian.

I've had such good experiences with other s/w authors that I was off my guard. The payment was only $20 US, so I'm not out _too_ much money, but it's frustrating not getting what I've paid for. I want to use G2E to translate docs for German s/w, I'd hoped that the registered version would do a better job than the s/w one. The s/w version creates a lovely word salad that's _almost_ understandable (sigh).

If anyone knows of a way to contact Carlos, I'd appreciate knowing it, by either post here or email. I'd like to try contacting him before I say in a public forum that I've been ripped off. Who knows, maybe the Post Office lost the letter or something? Thanks to all in advance for your help!

2962. Help with resources and more.

Message-ID: <EKPGCHUQUp@warpcon.ersys.edmonton.ab.ca>
Source record: 176782
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Although I'm relaying this for someone else, any replies can be
sent to him through me (as he doesn't have any access to the internet or
usenet (no hard drive or fast modem)). Any and all help will be very
appreciated, thank you.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

Thanks again for any help rendered.

Leslie

Please let me know what you find out. I was also comtemplated registering
the German to English translator. I would like to full compressed
dictionaries and hopefully a more stable program. Anyway, I guess I
am learning a little German in the process of trying to interpret the
word 'salad' you mentioned...Always fun to spend an hour trying to decipher
a page of text :-)....

Anyway, please keep in touch with any info you find out..

Take care,

Jeff

2964. What to look for in a used ST

Hi,

I'm interested in purchacing a used 1040ST computer. I have several leads
and I'm wondering what things I should check for when examining the
models. Any tips or suggestions would be GREATLY appreciated. Thanks,

>> Mark <<

Why complicate easy things, you only have to call tar:

tar -xzf mintnet.tgr

With the -z option, tar itself opens a pipe to gzip, you only have to hold gzip in the PATH

> Or, if you don't like pipes:
>
> gzip -d -v mintnet.tgr

I've never heard of '*.tgr' before. 8-)

Savino Grillo AB (grillo@olivea.ATC.Olivetti.Com) wrote:
: Hello there,

: I just downloaded TWOINONE a GEM-shell for archivers.
: It just doesn't work under NEODESK3, anyone has tried ?

: Savino

Ok. I was a little generic, let me explain better what happen: when I click
on twoinone.prg a message appears on the screen sayng : cannot find twoinone.sys
even if twoinone.sys is in the same folder from here I started the prg.
The system hangs until I press a key. Quitting from Neodesk all works fine.

Anyway thanks to all who replied, Atari has still a very good ccommunity.

Bye

So, yet again, we have people coming over here just to sneer at us and to tell us how stupid we are and how outdated our computers are and that we should "see the future" and go buy a pc/mac/whatever expensive pile of junk that will be outdated in a year anyway.

What the fuck is wrong with these people? Do they feel threatened by our tiny little user base or what? Why not just accept that some of us like to use our computers and intend to do so for a long time still! I use a Sun SPARC station 10 at university, but I still find good use for my old Atari ST. And if I had the money, I'd be glad to buy a Medusa or Eagle or whatever comes along, to sit on my desk right beside the PC486 and Jaguar games machines.

And btw, this Townsend guy really ended up looking like a complete idiot coming here to bash on his former employer. Can you sink any lower than that? What on earth did _he_ do that was so important at Atari? Judging by the poor results, not very much. If I'd been hiring this fellow he'd been looking for a new job, starting tomorrow!

Oh, and Roger S, don't bother replying with your smart remarks to this cause you're already in my kill file.

And be warned, next time I'll bring Jack and Sam (my killer pitbull terriers) along for a snack so start behaving yourself or watch out for big trouble! :-)

Just a point: The STE is much more suited for virtual screens than the ST
since it can do smoother hardware scrolling. (Don't know about TT/Falcon.)

RS> Does any one know if there is a pd program to use my hard disk
RS> as virtual tt-ram and where I can find it (ftp site ??)

Hello Richard,
as Uwe Seimet told : no PD but OUTSIDE !
We konw the older version as Demo, but realy good works OUTSIDE Vers.3.!
I for myself use TT 4+8 = 12MB AND OUTSIDE with 36 MB on a Syquest,
together 48 MB to prepare truecolor-pictures in Preview (tms) and
Calamus SL (DMC),
my CAMERON-Scanner 16 Mio colors works fine with OUTSIDE (DIN A4 in truecolor
-> more then 35 MB !!!).
You may use OUTSIDE till to 512 MB, I think!
In times before I used VMM, (VMM needs TT-RAM, OUTSIDE not)
but OUTSIDE seems to be quicker and better.

The price about 99,- DM for OUTSIDE 3. is a good investment (1 x 4 MB-
SIMs ~ 200,-DM).
This is the opinion from a poor user :-)

Lines: 16

I have a question about using clipboard on STs.
I know how to use system clipboard in editors to copy, paste etc text,
but I would like to know whether is it possible to copy pictures on the
clipboard to pass them to other programs to use those pictures.
(E.g. I draw a mathematical formula and inlude it to my text.)

Are they any programs available for STs similar to the Clipboard Viewer in
Microsoft Windows?

How do I copy graphics to the clipboard if it is possible?
Do I need any programs to do that? If yes, can you advice me any?

Thank you in advance
Matej

Got this the other day:-

APEX MEDIA FOR THE FALCON030

ANIMATION & MORPHING
Smooth image transformations
Powerful block functions
Block rotation to any angle, proportional rescale, stretch, skew & mirror
Direct-from-Disk editing to allow fast and easy video titling

DIGITISING
Multiple, real-time frame capture to 512x320 in 16-bit true colour
Rostrum camera work to 24-bit
On-screen PiP (Picture-in-Picture)

POST-PROCESSING
Dejagging, Motion blur and two levels of Noise reduction
Advanced Deltafilm compression of animations, reducing memory overheards

DRAWING TOOLS
Pen. line, curve, polygon, circle, box
Stipple Airbrush
Redefinable Grid
SPECIAL FEATURES INCLUDE:
Graduated circles, lines, boxes
Interpolative lines and boxes
Fill using definable blocks or gradients

NON-LINEAR DRAWING
Realistic Airbrush for producing soft graduated spray
Transform of defineable areas controlling hue, saturation and/or brightness
Brighten, Darken, Saturate, Watercolour and fade with compound inking option
Transform and masking of defined areas with fill or brush

CELL MANIPULATION
Paste block above or below existing image
Invert X and Y axes
Rotate to any angle, skew
Perspect, Rotate, Skew
Proportional Resize, stretch on X and Y axes

SCREEN MODES
Real-time zoom available at all times, even during animation playback
All tools fully useable under zoom conditions
Smooth scrolling under zoom or virtual canvas operation with any tool

FILE SUPPORT
PC1, IFF, SPU, PCS, TGA, MTV, JPG, GIF, FLC, SEQ, ANM, APX
Calamus (CFN) font support
Additional saving of Palette, field warp lines and set-up configuration
Import of images or animations with colour reduction, supersampling,
pasting over or under existing images

VIDEO SUPPORT
VGA, RGB monitors and TV's (PAL/NTSC)
Selectable resolutions; 320x200, 320x400, 640x200, 640x400
Virtual canvas up to 2048x1024
256 and true colour video modes
Supersampling of true colour images for 256 video modes
Enhancement of 256 colour miages with dithering and supersampling
Import of large images into smaller canvas sizes with fine scaling
Grey-scale conversion
Genlock capability

JCA Europe Limited
30a School Road, Tilehurst, Reading, Berkshire, RG3 5AN, UK
Telephone +44 (0)734-452416
Fax +44 (0)734-4151239

STEREO CAD
Object Orientated Stereogram Creator

JCA Europe Limited announce a new program to make your own 3D steregram pictures in colour or black & white.

You have seen the posters, you have seen the books you may have even seen the videos but now you can create your own 3D Stereograms with Stereo CAD for the Atari range of computers.

Some of the facilities offered by Stereo CAD are:

* User definition of three dimensional 'sliced' objects such as spheres, pyramids, tubes, stars and prisms

* Standard transformation of shapes (ie. location, scaling and rotation) in your scene.

* True scalable, rotatable text and freehand drawings.

* Ability to create stereograms infront or behind the page (cross-eyed or parallel techniques).

* Importation of PI1 format pictures for direct conversion to stereogram or as a backdrop to 3D object scenes.

* Exportation in PI1 format of finished scene with backdrop if any.

* Exportation in PI1 format of final stereograms for printing.

* User definition of final steregram finish.

* Novice section (Scribble Pad).

STEREO CAD will run on all Atari systems with Colour monitor / TV.
STEREO CAD costs #29.95 including VAT and Delivery within the UK.

2978. FOG> Falcon Update Issue 7

Newsgroup: comp.sys.atari.st
Date: 1994-11-15 09:52:49 UTC
From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3aa0dh$rvg@bs33n.staffs.ac.uk>
Source record: 177146

All FOG members will have issue 7 of Falcon Update Digital now so it's
only fair I should release it onto the Internet. Therefore I will upload
the latest issue to:-

ftp.uni-kl.de and
ftp.cnam.fr

It will be in pub/atari/incoming until they see fit to move it out!
Filename will be FOG7.ZIP and FOG7.UPL

Atari Falcon030 only.
VGA or RGB (Gaposcan provided - yes still!)
4meg memory required
Runs from hard drive or floppy drive this month.
66 articles, *NEW* text displayer, superb music, great graphics ;-)
Lots of bugs fixed.

Issue 8 coming out on December the 9th 1994 (hopefully).
Special two disk issue with an amazing cartoon animation direct from
Atari and a general christmas feel to the whole magazine. Christmas
soundtracker modules WANTED ASAP please!!!

Guess you were moving icons, right? :-)

Anyway, that Windows is stupid, When I first used it, I did not use the
Program manager, but used the File manager instead. This gives me a interface
just like GEM. Then only I learned the usage of the Program manager. Nowadays,
I am using dashboard inplace of Program manager.

However, I still like Tos 2.06 where you can place icons on the desktop and
using function keys to launch applications. Heard that the new windows can do
such thing or have launch buttons.

Regards
William

On Wednesday November 9th at about a quarter past five
jonal@hiof.no (*Jon A. Lovstad*) happened to write:

JAL>If you don't need the Type1 support, you could do well with NVDI
JAL>only. I believe Speedo comes with more fonts and drivers though.

There are several font-packages available with NVDI. And there are some pretty
excellent font-CDs available as well. Not to mention fonts you can get in a
BBS somewhere.

There are drivers for all major printers shipped with NVDI. In addition, you
get *MAKEPRN*. This little application allows you to create your _own_ driver,
if you have the ESC-Codes. Very easy to do :-)

2987. Fontier Elite II: HELP!! Please read this!!

Newsgroup: comp.sys.atari.st
Date: 1994-11-15 11:37:08 UTC
From: bensmith@teleport.com
Message-ID: <3aa6h4$2a8@kelly.teleport.com>
Source record: 177009
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been playing Elite II and I've just bought a 2000+ Ton Panther Clipper. It came with a Class 8 HyperDrive. On my ship, it has a range of 9.15 LY per Jump. Unfortunately, that's not far enough. Does anyone know where I can find a Higher Class HyperDrive than Class 8. Usually the Highest Class you can buy in most Ports is Class 7. Mine came equipped with a Class 8 Drive. The Manual for Elite II says "Although the classes are listed upto 7, higher classes exist but are ONLY OBTAINABLE FROM SPECIALISTS.". What do they mean by specialists, who are they? Where do I find the specialists? And Where do I find the nearest ones to the SOL System?

Also, now that I have a Panther Clipper, what is the Point in continuing the Game. I've been told that in some systems, their are ships not listed in the Manual for sale. Are their larger ships to move upto than the Panther Clipper? Or have I peaked in this game? What ships are their? Where are they? I'm hoping for one with at least 8 missile Pylons, the bigger the better.

Make sure you have NEOLOAD.PRG in your AUTO folder. Lacking that could be
the nature of your problem. (What version of NeoDesk 3?)

>so. Supports all serial ports ever made for Atari....

I suppose RatSoft can run Multitasking as well. It's an commercial program,
so why shouldn't it. Also i believe the author is working on whatever problem
new versions brings you. and that he behave polite to his costumors as well
when they report bug's and want changes. And there's ofcouse an demo version
available for test.

If you can answer yes to the above, then you lie.

Sorry to say, i had RatSoft for about a year. It made about 2 hours online
at my Falcon, then i just dumped it. To difficult and to many problems made
it impossible for me to run it. And when i turned to Steve to get some help
all i ever got, (if I ever got an answer from him), was a rude behaviour.
Thats not worth $90. Thats not worth nothing at all.

Things may have changed since. I gave away my RatSoft for free to one of my
friends, and since then, (actually since i dumped RatSoft), i have not spend
much time on it at all.

You can thank Steve and his so called BBS supporters for this.

An alternative to BBS's is Octopus, which is under heavy development right
now. Octopus is going to be the strongest BBS available for the Atari if the
author keep up his good work, (which he intend to do). Thats a promis!.

Figlet is indeed totally UNIX-minded. You need a shell with
output redirection to write its output to a file...

Very un-Atari. But that's the way we're going with MiNT
getting increasingly popular...

>either!

So then you run something easy to use and easy to set up like UPoint
(UPoint Lite is on atari.archive.umich.edu and other FTP sites).

I want something better, since I'm sick of my TOS filesystems being
beaten by the UUCP traffic. Minix filesystems will survive a lot more
punishment, and they only run under MiNT, so...

Well, there's nothing wrong with those chips (unless you count the '486s
pathetic floating-point speed), though the rest of the hardware is
totally crippled for DOS compatibility. PCI-based hardware is a bit
better, but it's still suffering from motherboard problems and very few
drivers for anything other than DOS/Windoze.

Now try adding a video card that does better than VGA. Oh, it comes
with drivers? Now try doing it for OS/2, or WindozeNT or Linux and pray
you can find drivers for it. What, your DOS programs don't support
anything better than 80x25 on that card? And all your games still run
at 320x200x256 despite the card being able to pull off 1024x768x16-bit?

>Nowadays, software are a whole lot better, some knows how to use EMS so that
>there is near to 0K usage of conventional memory. It is just afew option setup
>on the software.

The mere fact that you have to know anything about "conventional"
memory, or "expanded" memory, or "extended" memory is a serious flaw.
Memory is memory, on any system that isn't running DOS.

>It is the software that you're using that is really the problem. Get and use
>smart software.

It's a pity DOS is so minimalist; all DOS applications basically
re-write DOS and use the BIOS directly for speed.

>Now this is a area that is normally a nightmare to most ppl. Read the manual!
>and use a good diagnostic problem to find out what is used and what is not.
>Also try using the newest DOS, they allow you to skip loading device drivers
>at boot time, so you can boot up bare without any drivers.

What if your computer didn't come with documentation for the motherboard
or the cards that were already in it? *ALL* of the PCs I've seen sold
around here are like that, or you get a photocopy of some Chinese
documentation.

>I must say that this is a problem caused by to much support for the machine.
>There are so many HW products upgrades for the machine while the machine have

>competition and it drives the prices down.

Plug a video card into your VME port. Hey, no IRQs or anything as
stupid as that! Plug a scanner, or a SCSI Ethernet, or a hard drive, or
a tape drive, or... into your SCSI port (ok, so you'll need an adapter
for the silly ACSI port to convert it to SCSI, no problem).

PCs are crippled by the stupid, ancient architecture. PCI fixes this,
but there are too many PCI cards coming out with 8088 BIOSs on them
instead of supporting OpenBoot.

>>Whoever invented the darn system ought to be shot on the spot!

Apparently, GE-SOFT Computersysteme GmbH has changed their (voice) telephone number to +49 (2241) 406280; I got this from the telephone operators. However, no one is answering this phone number. I am trying to check on an order which I have already paid but has not received yet. In addition, my FAX (using the existing phone number has also gone unanswered. Are they on holiday?

You are not paying $25 to remove the disabled features, you are paying for
the whole package. The save once and paused intro screens are attempts to
make people register.

bd@st-andrews.ac.uk wrote:

bd>I've been writing programs for the ST for quite a while now, and
bd>I'm interested to see what Atari users think of the shareware
bd>concept now.
bd>What kind of quality and/or support do you expect from a shareware
bd>author?

In my opinion shareware should be supported for people that actually
register their program.

bd>What kind of programs make good shareware titles?

Everything :-)

bd>Is it worth producing shareware (i.e. will anybody actually
bd>register)?

Don't know that. Haven't see anybody see registrering my programs' but
they aren't avaliabl in the net...

bd>Which co-ercions (eg. Program function disablements etc.) or
bd>incentives (eg. Free future versions) are best, if any at all?

Depends. I make programs myself. Programs without any restrictions I
release as freeware, but the real shareware programs I have made (not
much) I limited the possibilities or made a demo for it.
But: Don't make shareware with almost no functions when not
registered, I very dislike those programs!

bd>It'd be interesting for me, as well as other budding shareware
bd>authors to find out more about this, so please, if you have some
bd>time, answer the above questions, and feel free to mention anything
bd>else.

Well, I'm interested too, because I want to make shareware programs
that users actually register.

bd>Other things I'm interested in are the level of compatablilty
bd>required (eg.
bd>across resolutions, older TOS versions and the like), and the

It should works on every machine, but it depends on the thing your
progream do.

bd>value of a typical shareware registration fee. Also how to deal
bd>with overseas regs. etc.

IMHO a sharewarefee shouldn't too much; since there is always a
possibility the auther doesn't supports his programor doesn't give you
ypur required key.
Besides, if the program is really good, why don't make it shareware?
But that's my opinion, all other opinions are welcome here....

> compatible with the old ST software, the Falcon is a fraction of what

If the Falcon was non ST compatible then I could see your point. However it runs *so* much ST software that its bound to be considered a glorified ST in some quarters. The TT suffers from exactly the same problem. It would have made a nice little UNIX workstation if it hadn't have been ST compatible. OTOH Atari still wouldn't have sold any - and the TT would be even more marginal than it is now.

> promise to stay with us is bound to be broken. and the next computer
> we buy will be made by apple or IBM. Maybe we should pump Atari to
> join in with Apple and IBM instead of whinging for a new TOS

Good idea. I'm on the verge of buying a PC, only because I don't think my TT will be a viable *single* machine solution in 2 years time. Two years is at *least* what it will take IBM/Apple to get their act together on the new style Prep machines - if they don't hurry.

But before anybody thinks I've gone PC soft - I do know how bad PCs are. I've just spent 2 evenings trying to fit a CD-ROM and soundcard into a basic 486 machine. It just doesn't want to play. Didn't have this much trouble with the Atari CD-ROM, and that a combination of spare parts and shareware! But thats not the point. Untill recently it was a question of stay with Atari or wait out for the Prep machines. However all the time this thriving PC market was surrounding me. So its more a case of having the best of both worlds than jumping ship.

Certainly I am by no means abandoning the Atari range. Whilst people are interested/interesting, I'll happily stay along for the chat :-)

:-)

Roland.

>money for something else.)

I talked to a computer science friend of mine, and he explained to me that a transputer is only fast for certain optimized algorithms. I already knew it wouldn't be ST compatible (although you can run ST software on it if you have the ST i/o card, which is a mega ST on a card). I knew I would have to compile TeX and such for myself.

I'll wait for the '060 board prices, though.

BTW, offers last until end of november!

A followup post gives some specific info, but I just wanted to point out
that the file 0cdrom_availability on atari.archive.umich.edu also contains
this info. It is in the root directory, you can't miss it.

The FM models have a port marked "televison", which is desirable IMHO (cool for playing games on your big TV). If possible, you should have the seller run some programs for you to determine important info. For example:

sysinfo: TOS version, among other things.

DC Max Tracks: How far out the floppy drive can format/read/write (at least 82 tracks is very desirable, as some games, popular alternate formats, and most demos won't work on anything less).

RAMtest (or other memory tester): check the memory, of course.

All of these are available on atari.archive.umich.edu, among other places.

In addition, I think it is fairly common for machines with the 1040 style case to have damaged joystick/mouse ports, due to their braindead location. These should be tested. I hear it is easy to destroy the parallel port on any ST (by hot-swapping devices hooked to it, as it was not designed to handle this very well), but I cannot confirm that.

Source record: 177028

> How does the TT use 8megs of ST ram? Can the MSTe be 'modified' this way
> as well? Can you specify the header bits, etc?

The TT030 can access more ST RAM because it's using a 68030 processor
with a built-in MMU that can access more memory than the MMU in the
ST/STE, which is external to the 68000 CPU and was not designed to
access more than 4 megs of RAM.

To the best of my knowledge, there is no simple way modify an STE to
access more than 4 megs of ST RAM. Even accelerators such as the SST, for
the Mega ST, didn't extend the access to ST RAM... they replaced it with
Fast RAM (TT RAM) which was accessed via the 68030 processor in the SST.

Yes, they are backward compatible in most cases!!!

I can't understand why the FIDO-programmers use the caux-functions of the GEMDOS. Atari itself recommends _not_to_use_ this functions and use the BIOS directly instead (I think one reason is the possiblility that these caux may be redirected to another handle.)

I know why these functions do not work. I will try to fix this in the next release, for such (sorry) bad programs as these FIDO-ones (Atari didn't say much, but to ignore what tey said, is not well.)

By the way: the result of cauxos will not depend of the status of the CTS-line, but only of wether there is romm in the buffer (the same as Bcostat).

: Rumour has it ATARI are going to start making ST's again; hopefully
: this time with room to expand. Don't know when though!

Makes sense, it is a good way to get into the new market in the east.
Making a machine that is cheap, and has loads of nice software for it,
if they grab a big chunk of the market it will most likely result in more
software for the ST.

Atari really has a golden opportunity, especially since Commodore is no
more...

: I'm looking for a Tape streamer for my Falcon (QIC-80).
: IDE-drives are very cheap compared to SCSI
: Is it possible to connect a IDE Streamer to the Falcon ?
: and what about software that supports IDE drives???

The tapestreamer you mean is Conner 250 or equivalent.
The streamer is not connected to the IDE-interface, it is connected to the floppycontroller, and thus should be able to connect with any computer which use standard floppys.
Unfortunately, I haven't seen any software for those streamers for the Atari, nor have I seen any documentation on how to access the streamer from software.
(Besides, the streamersoft on the PC is far from good)
Anyway, if anyone can get that information, I would be very interested, since that streamer would be very nice to have for my STE/F030.

> Is anyone here using an atari for packet radio?
>
> If so, what software /hardware are you using?

Yes, indeed - several in fact. The core machine (that does the most work) is a 1040 using the KAOS 1.4 ROM's. It has 8 ESCC channels and 2 SLIP links at 31,250 and 38,400 baud for local inter-machine hook up. The ESCC channels run 2 x 9600 and 6 x 1200 baud ports. The machine is very busy indeed and the local BBS is running on a 486dx80 (cos FBB is PC based).

The software is Rob Jansenn's (PE1CHL) excellent version of NET, which is virtually bombproof on a PC and on the Atari's - well, it IS bombproof and runs for months on end without ever needing a reboot (and this machine handle's 10's of megabytes per week).

I have distribution archive's on my BBS for both the ST and PC machines complete with setup info and real-life sample configs - getting them is more of a problem. You'll find various sites for the code - have a word with an Archie and then if you need the support sample files I have then I could post those as UUE stuff. If you can handle a dial-up SLIP connect, then I can make a port available overnight (I have only one line) at V42bis.

Cheers, Martin.

On Tue, 15 Nov 1994, Clinton N. Keith wrote:

> Over the last 12 months 1 gig drives have been halved in price and size.
> Same as the previous year.

The point is that I shouldn't NEED such a large hard drive, especially for just an OS. I read an article once in 1986 that said that an OS should not use up excessive system resources. This I whole-heartedly agree with, so it's funny and disgusting at the same time that most modern OS's use up excessive system resources. The OS should be the most highly optimized part of the system. It's there as a facility to be used by other software. The OS is not a package of software like a wordprocessor; it's the heart of the system, and therefore, it should be made to allow the other software to take optimal advantage of the system resources. When an OS is so big that you can't run your apps or it's so slow that your apps, even efficient ones, find the OS to be a major bottleneck in some way or other, then the OS is not fullfilling its purpose. These inefficiencies do not allow software to take optimal advantage of the system resources.

Windows, OS/2, System 7, UNIX and others suffer from these problems to some extent or other. Windows is too big and very slow. OS/2 is too big and a little slow. System 7 is too bog and EXTREMELY slow (40k of code to perform a context switch? Come on!). UNIX is HUGE, but it's fast and if you're running a very large network, it's not so bad.

>

> writing for Windows.

Define 'more productive'. Do you get more work done faster? Is it easier? I rather like programming my Atari, and after I developed myself an application framework than handles windows and windowed dialogs and other thing autmatically for me, I became yet even easier, and I can throw together a simple GEM app in minutes because either the facilities are in the OS or in my library.

People who I know who develop for both Atari and Windows have almost consistently told me that programming an Atari is MUCH nicer and easier. Well, I don't recall if they said anything about faster, but if something like this is nicer and easier do, the development time is probably much faster. Just ask Damien M. Jones (of dmj sofware). He programs all say on PC's, and comes home to and programs his Atari to RELAX.

> Much of this has to do with the tools which
> pack in alot of stuff which should be dynamically linked, but also with
> the idea that the most critical cost measurement of software is the
> programmer's time.

Oh, and another part of the system that should be HIGHLY optimized and very well built is the compiler. Of course, Microschmuck and Borland produced for us complete crap. At least Borland's stuff was fast, but some of their optimization techniques are questional at best, and the object code it produces is HUGE for even the smallest programs. The Microsoft compilers are awful. Sure they have relatively plush development tools, but the results suck.

Compare "hello world" programs:
68000 ASM: 92 bytes
Watcom Fortran: about 300 bytes
Laser C: about 6k
Borland C: about 12k
DBase III: about 100k

Doubtless, Microsoft visual C++ would produce something on the order of 40 or 50k.

> If I have the choice between 1/2 the time or 1/2 the

> on a 1 meg Atari is worse than a "bloated" 1 meg exe on a 8 meg Windows
> machine. Memory is a relative resource.
>

You should NOT need more memory simply so you can run your OS. More memory should be there for the USER so he can make more effective use of his system. As a result of inefficiencies in OS design, you get nothing out of 16 megs with Windows NT, while you can't fill 16 megs of RAM on a TT, even while running several programs at once.

I agree that development time is important. As a result of my application framework that I use for my Atari, my applications have a minimum size of about 26k, rather than about 12k for programs that had to be developed from scratch and took on the order of 10 times longer to develop. That 20+k library is a worthwhile sacrifice.

On the other hand, when an OS is so large that your size sacrifice is on the order of megabytes or tens of megabytes, then it IS laziness. There is no other reason for the flagrant inefficiencies in Windows and System 7 than simply extremely lazy developers. Maybe not the individual programmers, but the company that pushes the programmers to develop software that may come close to working, regardless of size or speed.

UNIX is an exception because it's an OS written by hackers originally for machines with 64k. The name UNIX is a play on the name Multix. At the time, Multix had gotten so big that some people decided that they wanted to do better. Multix was designed for large systems and many users, so

they designed Unix to be small and for single users on small systems. This was back in about 1970. Over 24 years, Unix has grown continuously. Independant contributors each developed utilities some of which had overlapping capabilities. Additionally, the core of the OS has been improved and adapted to countless different systems and requirements. Memory protection, threading, and virtual memory were certain not part of the original design of Unix. Considering the time it's been around and the number of contributors, I'm surprised it's not larger. The biggest reasons that Unix is so efficient is that is had to start that way. Originally, you had to fit the OS into a small space, and you had to make it very efficient, or it would be very slow. Unix is also very capable for its relative efficiency since, to some extent, programs that compile on one UNIX machine should be compilable on another. This isn't always true, but it's due to slight differences in different implementations of Unix which don't usually pose that much of a problem.

The large apps and OS's being produced by awful companies like Microsoft are that large not simply due to an interest in reducing development time. It's due to stupidity and the fact that they can fool most idiot Americans into buying any crap they want to sell. It's like selling refridgerators to Eskimos, except Eskimos probably have some intelligence.

3040. How much would my 1040 ST sell for?

Hello to all;

I have a question concerning some Demos i've been trying to run unsuccessfully as of late. They are the Humans Demo, Plastik, Knockout and the latest is the obsession pinball demo. My problem is the same for all. When i load the demo, the screen display is all garbled. Now i realize that some of these demos may be RGB and will not display on my system. Most of these do not have any file stating the video attributes. But i became suspect today when i loaded the obsession demo and witnessed the same problem. Only this time the read.me file states it will work on either RGB or VGA. So now i'm stumped.
Is it the Demos or The system.
My system consists of a Falcon 030, 4 meg ram, 270 mb HD and a SVGA monitor.
i usually run warp 9 v3.81.
I would appreciate any help or feedback from people who are able to run these demos with a SVGA monitor.

Thanks in advance.
Al Huyghe

] in the Manual for sale. Are their larger ships to move upto than the Panthe
] Clipper? Or have I peaked in this game? What ships are their? Where are the
] I'm hoping for one with at least 8 missile Pylons, the bigger the better.

All there is to do in the game after getting the biggest ships, is to
fly around, and kill bad-guys & complete missions to increase your
Elite and Federal/Imperial ratings. That's it! It gets very boring,
very quickly after gaining the powerful ships!

BTW - What's this garbage about Large Plasma Accelerators being used
for planetary assault!? I can't even obliterate a space-station with
one, although those space-ships that look like chocolate fish don't
last long! :)

Down in the imperial system you can get Imperial Couriers & Traders.
These are very fast ships, good for missions etc. Not too great
for money making due to the not-all-that-huge cargo space.

The Panter Clipper is the _largest_ ship in the entire game. Apart
from its limited warp-distance, it's the best. It is possible to stick
class 7 or above Military drives into it which increase its speed
somewhat. Most of the places to find huge drives are hundreds of light
years away from Sol.

: : Hi: I have a friend who has an Atari computer. He wants to know if he
: : can use it to access the internet?

1. If he can get Internet access with a "command line" interface connecting with the Atari is as simple as using any other computer...maybe simpler.

2. Check out Public Access Internet providers for access...most will have command line interfaces (i.e., text menu based rather than mouse/graphics driven such as Mosaic).

3. Get an external 14.4 modem...these are now available for about $90 and a telecommunications program. Stalker has been mentioned. The old standby Flash has served me very well...be sure to check the additional features such as y-batch protocol in the disk documentation. There is also a new version called Flash II. Both these are quite inexpensive.

Please enter your message below. Control-Z when Complete. /HELP for Help.
Just wanted to start a discussion on a couple of Video Board
adapters that have been mentioned here on our SIG lately.

The first is VOFA, a DIY project from Germany. Apparently, it instructs
the user to build an adapter that joins to the motherboard and allows
a VGA graphics board to be plugged into it and used for the system
video. This allows for 256 colors on-screen from a palette of 65,000.

Needless to say, for a lot of us ST users, this could be an exciting
solution to the color barrier on our systems. I do have a few questions
concerning this package (Which includes drivers, installations progs,
a schematic, etc).

1. Has anyone here actually performed this modification?
2. Doe this modification require a VGA monitor or can a SC1224 be used?
3. Does anyone have an English language version available? (My German
is very limited)
4. What is ET4000? Is a graphics board or a graphics standard? Is
it available in the U.S.
5. Does this modification work on 16Mhz 68000 machines?

The second solution mentioned for color enhancements is the MultiBoard,
apparently a system addition that adds expansion ports to the ST
line where a VGA graphics board can be plugged in.

1. Where is this product available?
2. I assume it is commerical, what is the cost?
3. Are there any U.S. or U.K. distributors?
4. Will it work on 16Mhz 68000 machines?

If anyone can offers information that may clarify some of the
above questions, it would be greatly appreciated, as I would
love to be able to colorize my system a bit.

Take care,

Jeff

This statement is no longer true, SCSI prices or now much the same as IDE,
any way SCSI is a far better standard..

Here in NZ SCSI prices are now the same as IDE, most people the buy a good PC
clone these days go for SCSI, they work better in a multitasking OS..

In the USA I think they are $25-50 dearer than IDE....

Anuy old modem that is a standard RS232 modem will do. Althoughtry
and persuade him to get one with a baud rate (speed) of 9600 bps or more.
Also as regards software, I use ConNect, which is actually quite nice.

The only cheat I know of is the one that gets you more money. You just have to type CASH (with the Shift key held down). Or it might be MONEY, or it might be FUND. Either way, you get an earthquake every fourth time you cheat, so it's best to stockpile cash at the start of the game before you've built anything.

: as a printer for a PC. That is use the STE/laser printer combo to emulate a
: PC-compatible printer. Has anyone ever (reliably) achieved this result?

Sorry, but that is most likely not possible.
The SLM is a very simple laserprinter without any memory, and on top of
it all, it is connected to the ST via DMA.

Lately, there has come a lot of so called windows-laserprinters for the PC.
They are very much the same as the SLM in the way that thay do not have
any memory of their own.

A laser without any memory of their own uses the computers memory, and
that part of a SLM printerdriver for the PC should be easy.

The main problem is how to connect the printer to the PC, and to write a
working SLM driver. AFAIK there is noone that has done that.

Since the SLM uses the DMA to communicate, and there is no DMA interface
for the PC, it should be virtually impossible to connect it, BUT, with
the introduction of Falcon 030, an adapter-interface has been made, that
makes it possible to connect a SLM via SCSI.
So you could get a SCSI-board for your PC, get one of those
adapter-boards and connect your SLM.

Then you have to get a SLM-driver for your PC, which is the hardest bit,
since I don't know of any person who has written such a driver.

The other solution (and probably the cheapest too if you don't have a
SCSI-interface in your PC), is to sell off your SLM, get a new laser that
can be used by both PC and Atari.
Here you can get almost any laser, except for those without memory (aka
windows laser printer), unfortunately the cheapest lasers are also those
without memory...
But a cheap and good laser that I can recommend, is the Hewlett Packard
Laserjet 4L, you should be able to get one for about 500-600 USD, but I
can't really say, since I'm from sweden, and have to estimate a probable
prise in the US.
The HP 4L connects to your printerport, and you don't need a
printerdriver for it as long as you only print text, and even then you
can do it in any of the 26 fonts that comes with the laser, in any size...
And there is even software-support for that laser, I've seen a lot of

utilities/drivers for it that is available via FTP.

Regards, Tommy

From: pd@mole.bio.cam.ac.uk
Message-ID: <3acpe5$hpb@lyra.csx.cam.ac.uk>
Source record: 176959

My brother has been playing the first Elite for a long time now.
Just recently, he has come across several missions he had to do. Such as
the supernova, thargoid invasion etc.

The trouble is, he is stuck on the mission where he is told to destroy a
nearby space station which has been taken over by aliens (thargoids). The
station takes one shot (!) to destroy but then huge numbers of thargoids
appear from inside it. Even when he managed to destroy all these, there
doesn't seem to be anything else to do. Any other systems he jumps to
after this are also controlled by thargoids.
What should he do next?

Thanks for any help,
Phil

>I've been writing programs for the ST for quite a while now, and I'm
>interested to see what Atari users think of the shareware concept now.
>What kind of quality and/or support do you expect from a shareware author?

Obviously it has to be better than the freeware competition. I would expect
the author to fix bugs as soon as possible and to develop new versions for as
long as he can think of worthwhile additions.

>What kind of programs make good shareware titles?

More or less anything; utilities which are used every day in particular are
good. Games are not so good, I normally get a game, like it enough to register
but by the time I get round to doing so I've stopped playing the game so don't
bother.

>Is it worth producing shareware (i.e. will anybody actually register)?

Yes if the price is reasonable you will get registrations.

>Which co-ercions (eg. Program function disablements etc.) or incentives
>(eg. Free future versions) are best, if any at all?

Extra but non-essential features are probably the best thing; for example the
zoom mode on Kandinsky, or the Hydra full duplex protocol on Semper.

I wouldn't offer to mail people future versions as this could cost you a
fortune in postage. What you could do is offer to provide the latest versions
if they send a disc. One advantage of the key system is that you don't have to
supply registered versions at all, so people can just ftp the latest version
and type their key into it.

>Other things I'm interested in are the level of compatablilty required (eg.
>across resolutions, older TOS versions and the like),

Depends what for; I think in a game people can excuse poor compatibility, less
so in an application. Don't make your program require a new TOS version, but I
wouldn't bother going out of your way to work round bugs in older versions as
few people still have them. Don't require MiNT or multitos but make
sure your program works under them.

> and the value of a typical shareware registration fee.

Again it depends on what type of program, I wouldn't ask more than a fiver for
a game, but you could probably get ten or fifteen pounds for other programs,
perhaps even twenty if it were really good and there was no competition.

> Also how to deal with overseas regs. etc.

If you use a key system like Selectric or Gemview then postage costs are negligible (or zero by email) and so the cost of supporting overseas users are not high. If they pay by Eurocheque then although they will pay costs you will still receive the amount written on the cheque, this is probably the easiest way for European users to pay. For users in the US and other places it's not so simple, either ask them to send you ukp cash or if you expect a lot of registrations get someone to handle registrations for you.

> (E.g. I draw a mathematical formula and inlude it to my text.)

It is certainly possible, I don't know what software will use it though. I
think Kandinsky and Papyrus do.

>Are they any programs available for STs similar to the Clipboard Viewer in
>Microsoft Windows?

Some versions of the cpx will let you view the clipboard.

>How do I copy graphics to the clipboard if it is possible?

Just select them and do copy. it depends of course on the program you're using.

> it all, it is connected to the ST via DMA.

I don't see this point. A ST(E) together with a SLM laserprinter should
theoretically be able to work as a full-fledged PC-compatible printer.
However, you would have to write software which is able to
a) read data from the parallel port
b) convert these data (most probably ASCII, PCL and postscript) in a
format suitable for the SLM
c) write the converted data on the DMA port

The most difficult part of those is probably b). Since the Atari can't
do multitasking, you cannot use Ghostscript to convert postscript since
you have to run at least one additional program which serves the ports.
Ghostscript is also not suitable for PCL data (so maybe it's easier to
write software for a PS printer than for a HP-compatible?).

I am not aware of any software which does this; my Atari is about 250 km
away from me, and I'm probably not capable of writing such a beast; but
I think that it should be possible.

Of course you can also buy a HP Laserjet 4 (a really nice machine), but
it's much less fun :-)

I want to connect a Mega STE/TT keyboard to my Falcon. I know you can connect these keyboards to an STE (I know how to do it.) but are STE and Falcon keyboards compatible? I could try, but after having waited several months for my Falcon to arriv, I don't want to destroy it... :-)

I also want an accelerator (Preferably one with fastram ("TT-ram")), which one's the best? And most importantly, *where* can I get one? I'm not very interested in the Speed Resolution Board, as I've heard you have to modify the Falcon motherboard a bit. But if anybody have fitted this accelerator themselves I'm happy to hear from you.

A last question: Is it possible to *remove* the RIAA-amplification on the microphone-input? I *don't* just want to reduce the gain, I also want to remove the bass boost and the phantom power.

>pictures to a file.

I could add a switch for 'save to a file' to the atari version of the
next figlet version (when it's available). If anyone needs saving to
the old version, feel free to compile figlet yourself (I haven't got
the sources anymore...). You could also use an Amiga, PC or Unix
version as all these OS's have a cli as standard (Current GUIs are
insufficant for 'serious' use) or get some atari cli from the
a.a.u.e. Cli/ directory.

Btw. There has been talk about adding a support for compressed font
files. That should get my figlet fonts directory size down by 1/2MB
:-).

From: josk@Lise.Unit.NO
Message-ID: <3acu96$10u@ugle.unit.no>
Source record: 176973

I don't understand why people are still arguing about this. There is *no*
question that the average PC (DOS/Windows-computer.) have several advantages
over a normal Falcon.

1) It's a lot faster.
2) It's got slightly better (But not very versatile) graphics cards.
3) Better sound (Most people have a SoundBlaster or a GUS.).
4) Better keyboard (Which is quite important.)
5) Cheaper hardware.
6) More software available.

Anyone who hasn't understood this propably owns an Amiga...

So what? I use a lot of different OS/computers, but I prefer my Falcon. OK,
the PC's are faster, and the SGIs at school are "better" in every sense, but
IMO they suck. I've got the programs I want (Hey, I've even paid for some
of them!), the OS is so much faster and nicer, and I've got lots of friends
with Ataris. So if anybody thinks that the ultimate thing is to own a PC because
that's what everybody else owns, they have missed something. The lack of
individuality makes these people pathetic...

I just don't understand what all this 'wake up people', 'your computer is old', 'get a real machine', and everything else that has been floating around.

I usually don't say anything, but I think something needs to be said.

What makes a computer old? What does a Real machine look like?
Does it really make a difference if you are running at 5mips 20mips or 100mips?

I just don't understand the need to be 'in the times'. To me it sounds like we are trying to say, 'but, everybody else uses one.' What determines a real machine or a new one is how many people use it? To me, that does not make a machine good! What if everyone wanted the same car? Would that mean that I am crazy for wanting a different one, even if it is slower than what everyone one else is driving?

All this talk is subjective, with No substance whatsoever. What is happening in the market today is sad. We are losing the freedom of selecting a computer (TOOL) that fits our discription of what it should look like and run like. Many of us choose Atari for that reason alone. (not everyone wants the fasssest Car, so why all of the sudden should we what the fasssest Computer, or one with the biggest OS)

Pretty soon, if you like it or not when you select your computer, you will have the 'COLOR of choice' but not choice at all. It's either computer A no matter how dressed up or different it looks, or no computer at all...

I have other computers, but I favor my Atari. I barely use the other ones. It does not make them bad. I just don't like the way it 'feels.' The Atari computer, currently fits MY discription of what a Personal Computer should work like.

Vince

P.S. John, this is not directed at you. For what I have heard Taligent sounds like a promising OS. Also if the Atari became a PReP Machine, it could use any software....

gluijten@dcakl.knoware.nl (G.C.J.M. Luijten) writes:

>When would it be available ?

This is still a difficult question. It seems a sound project, in the sense that there is enough interest. There are a few problems however. First of all I personally don't know whether it would not be better to give the port of Edith Professional to X windows first priority. Second, the operating system scene on the Atari is a mess, which means that developing a good Web browser with a fool proof user interface that and installation program that work on any system is very hard (perhaps impossible) to achieve (even *if* we are certain that MiNT 1.11 will soon get a GNU public licence).

Chris is certainly working on the HTML parts, so a stand alone application will probably be available one day. But even for that, have patience! As to a networking version, our investigation of the average quality of SLIP connections on the Atari is not in a stage where we can say whether our goals are achievable. (I personally can't get a SLIP connection running at all yet as Kay's MiNTnet believes I am not the super user...)

For ZFC (read: myself), I am currently taking a few months of vacation (which means no programming, but of course still all the administrative and sales bits), so I can concentrate on my PhD work.

A definite decision will be made roundabout the 1st of January 1995. We will then post an announcement on the news that the project is definitely on (or not).

I agree with you in all of the above, BUT one thing, you can`t be serious about the better sound. Can you ??
I mean the SoundBlaster and GUS .... aaahhh come on, none of them has prof. sound quality. Especially not the SoundBlaster. The Falcon has. And the DSP does a lot of heavy stuff, when it comes to sound processing or more generally Digital Signal Processing.

One of my friends has a GUS, and it sounds nice, but it doesn`t quite kick like MegaTracker on the Falcon to take an example.
And here in Denmark the GUS is VERY rare, my friend is propaply one of ten people who owns a GUS. And I have only seen a few demos that utilized the GUS card.

But anyway - good statement you made. :-)
You`re right - So what ?!

Hi !

Does anyone knows how to save time after turning
computer off ?
I've haded instructions how to do this through
the ROM modul port (but the electronic
components - especially CMOS MSM5832 has not
been abled to me (MSM5832 is a clock chip)...
If someone wants , i may send him this instructions
in a file (actually in a picture file) ..
So what's bothering me ?
I know You all have TT's , Falcon's, Mega STE's ,
but i have only an old STfm (with only one MB - sigh)
with hard disc and modem ..
I'll be very grateful if someone could tell me or
explain me how could i do this 'time saving' ?
Or, at least, give me some hints about that ...

Gratefully,

Neven

Does someone know how to get Jekyll to work ?
I have BEST2400L modem ..
(2400 bauds)
I type the following:

atz
atdt629711

Jekyll then writes 'Connecting ...'
then (after a short time) write
'CONNECT 2400' and after that
(Immidiately after that !)
link falls out ...

I have Jekyll 1.36, and I've tried setting
time register S7 (i think that's the one) to
a value 90 (with ats7=90) - but the some
problem happens again ..
Maybe someone could post me his Jekyll.cfg file
(config file), or try to tell me where
is the problem ?

Thanx

Hi there,

I think it`s a great idea. And name PONG2000, especially `2000` is surely inspired by the Jaguar game TEMPEST 2000 - Right ?

I have tried the demo and I think it needs a lot of polishing before you release it.
First of all, it`s a bit too fast. It very frustrating at first.
The beep part of the sound is too loud compared to the background music.
THe graphics are VERY nice indeed, beautiful TrueColor pictures.
Unfortuneatly there are sometimes some bugs in the graphics like the sprites disappear when they move the to lower end of the playing area. I`ve only tried it on VGA, so I can only speak for that.
Nice scroll!!

I hope my comments weren`t too destructive. :-)

The card has it's own resolution enhancer software (not bad, but BlowUp's is
much better) and BlowUp ceases to work once the hardware is installed.

Note also that to use 640x480x65536 you HAVE to run at 20Mhz bus speed. It is
a question of buswidth, otherwise blowup could probably do it, too.

Steve Wells (wells_s@ix.wcc.govt.nz) wrote:
:] I thought that MiNT and MultiTOS had to run at the same time?
:] If it does offer any benefits how can it be done?
: MiNT is the multitasking piece of Multi-TOS (hence the slow speed),
: it is possible to run it in a single-tasking mode apparently, but if
: you're using TOS 2.xx or better, I can't imagine wanting to bother,
: as there's not a great deal of benefit.

Let's get this straight: there are two components of MultiTOS: MiNT (the multitasking kernel) and the multitasking AES.

In the release version of MultiTOS, the multitasking AES is the slow bit - MiNT is very good speedwise. It is possible to run MiNT with the normal ROM AES - this allows use to multitask TOS programs using Miniwin and access MiNT filesystems (e.g. MinixFS, RamFS, NFS/MiNTnet etc.).

Unfortunately, the one exception to this is that the MiNT released with MultiTOS CANNOT be run with the old ROM AES. However, MiNT v0.9x (for which binaries are available from most ftp sites) does work, as does any version released by the MiNTlist in source form (although only with memory protection switched off).

When MiNT 1.11 is released in binary form (very soon) it will work with the ROM AES, apparently even with memory protection switched on.

I am not going to side with anyone on the debate as far as Mr. Townsend's work at Atari is concerned. I have no knowledge of what happened. However, I do have a few words for Roger.
I am sick and tired of you insulting everyone that has a differing opinion than yours, Roger. This group is to help other owners get the most out of their Ataris and to discuss Atari ST/TT/Falcon developments. I have seen you insult people because of their lack of knowledge on certain topics here. Well, Roger, in case you don't know this is the place for people to learn things about their Ataris. There is just no excuse for the way that you respond to some posts. I have seen you insult someone asking a question and then post a question of your own pleading for help. The reason that this is not in e-mail is that I want to make it clear that people should not be afraid to post here because of people like you who are quick to respond with snide remarks and insults. This forum is for everyone and everyone should be made to feel welcome. As they say, "If you have nothing nice to say...."

Yes!!! I love this game! Any others?
(Maybe Rebelstar, my other huge favourite)

>Format PD directory and if they are any good they'll stock it.

Are they FTP'able?
(the Falcon version of the emulator + games)

Thanks,
You will have made my day if I can get to play Rebelstar again!!

>: Obsession is nothing like the Pd game Starball. Obsession has a lot more
>: features including top quality stereo sound, graphics which are superior and
>: also a ball which obeys the Newtonian Laws of Gravity, not Starball gravity.
>:

I have to disagree here and say that I consider Starball to be technically
a better game than Obsession. I saw Starball first, and when I came to play
Obsession this is what I thought.

1) Major gripe - the ball seems to be just superimposed on the playfield, a
plain un-involved bitimage. The reason (IMHO) that Starball's ball seems
to fit better is that if you look, there are lines on which are animated
to give the illusion of a rolling ball.

2) Size. The playfield on starball is MUCH bigger, there simply isn't enough
of the table in Obsession.

3) Graphics quality - the main playfield in starball is much better drawn (ok,
some of the bonus screens are a bit cheesy - esp. Llamaball, but I think that
was the intention).

4) Scrolling is comparable on both, but Starball does have a lot more going on
besides a scrolling playfield (invaders, etc) which makes it technically
more impressive.

5) Obsession is closer to a Pinball table than Starball, simply because of
the above (4). But it doesn't have the depth of play, as the number of bonus'
available is very limited.

6) Attention to detail. In Starball, a lot of work has gone into the little
details like the bumpers at the bottom (they flash when hit, get gradually
more rugged, then explode). The little details like this are missing from
Obsession - if it is intended to be a top class pinball game, then small
things like ensuring that a rubber bumper will give a bit, then kick out
as a ball is pushed away would have improved what is currently a very static
feel.

Both are good games, but it is a shame, that Obsession didn't get that little
bit extra as the chance was there to make a damn fine pinball game.

>: Please do not compare Starball to Obsession, it is a bit like comparing a Mini
>: with a Merc.

Not really, as Starball has the trimmings, more a sort of Rover 620 with a base
model Ford. Both are sturdy built, and do the job - but the Rover has the extras

that make a real quality product. (Rover==Starball, Ford==Obsession).

>And you wouldn't be just a little bit biased at all... would you? ;-)
>For what its worth Starball is a completely different game, just coz they

Yeah - it's a shame, 'coz although Starball is great, it would have been nice to have a definitive 'pure' pinball game as well.

Craig.

Source record: 176757

On a related note, it's been discovered that ALL (100%, every single one, it's a design flaw) of the Pentium processors have serious bugs in the floating point division code.

I've verified this on my Pentium at work. For the latest details, go see comp.sys.intel. For a quick demo, try doing

```
x = 4195835
y = 3145727
z = x-(x/y)*y
```

on a Pentium and any other x86 chip. The Pentium gives an answer of z=256; the others give the correct answer of z=0.

If you were planning on getting a Pentium, better put it off until this gets resolved. Hopefully a software fix will be forthcoming; otherwise I've got a number crunching machine that can't do number crunching reliably.

Does it look as if GNU stuff for the Falcon will run under Dextrous. The reason I ask this is because it requires TOS and MiNT.

| /_/ /_ / Computer student at University of Linkoping (LiTH)
|/atrik __/anfridsson / E-mail: t94patsa@und.ida.liu.se, z94patsa@isy.liu.se

I did NOT.. I repeat DID NOT bash my former employer. What I was trying to
do was convince someone who posted that there was going to be a PowerPC
based Falcon that it wasn't going to happen.

I was also trying to convince others that while the Atari ST is a great machine,
its dated. It doesn't compete with the rest of the computing world anymore.
However, that doesn't mean that it isn't a good machine. Its a great machine.
If you enjoy using them, then please.. continue using them. But, don't expect
Atari to put out anymore machines.

They have said publicly that they have taken write-downs on their PC side of
the business (that means the personal computer, not IBM PC business) and
they have discontinued it. That means that you probably will never see another

improved ST from Atari again. (That doesn't mean that someone else like the Magic folks or the various groups in Germany that are working on improvements won't continue.. In fact, I think there is a good market for them)

My point was simple: Atari is out of the computer business. Atari ST products are dated. If you enjoy using them, continue using them. Just don't expect Atari Corp. to provide you with that PowerPC Falcon you dreamed of. It isn't going to happen.

(The whole reason I posted in the first place is that I wanted to stop someone who was hoping for something that isn't going to happen. I hate to see people waiting for products which are never going to be developed. I would rather see that person take their money and buy a ST-clone from one of the German groups or a Mac or (shudder!) a PC. At least then they have something they can use and enjoy now. I hate to see people waste their time waiting for rumors that aren't true)

Anyway, I guess I am sorry I ever spoke up.

On a different note: While I didn't agree with everything that Atari Corp. did during my time there (in fact, I disagreed with lots of stuff and spoke my mind) I do appreicate all that they did for me and I think they have a hell of a product
in Jaguar. The games are starting to roll in now and they look hot. I saw AvsP ads on TV last night, everyone is talking about them. Not to even mention the amazing deal they pulled with Sega. I really feel pretty good about Atari as a company. They still have a long way to go, but I feel pretty confident that Sam will lead them to success in that tough market. So, please.. don't misinterpret my comments about the ST being outdated with comments about Atari. I
like Atari, I have friends there and I wish them all the success in the world.

Take a look at the hangup string in both your friend's modem program and
in Rufus. It could also be a difference in internal modem register
setting (look for "drop DTR delay on carrier loss", and other similar
settings).

Some hardware is required to do this. There are several such devices
available. You want to make sure you get one that uses only hardware (no
software driver required), so the PC keyboard works with all games and
such as well. The DEKA or DEKA II are example of such, and I think there
is a relatively new unit for sale in the UK.

Wells_s@ix.Wcc.Govt.Nz,
In a message on 14 November, wrote :

we>] I thought that MiNT and MultiTOS had to run at the same time?
we>]
we>]
we>] If it does offer any benefits how can it be done?
we>
we> MiNT is the multitasking piece of Multi-TOS (hence the slow speed),

UTTER BULLSH*T.

MiNT is *not* slow. It is the multitasking AES in gem.sys that slows
the machine down.

MultiTOS = MiNT + new aes (gem.sys).

You can run MiNT without gem.sys, and then you can see for yourself.
Just rename mint.prg to mintnp.prg in your auto-folder. Then edit
mint.cnf and comment out the line that says "GEM=c:\multitos\gem.sys"
by putting a "#" in front of it.

With the newer (possibly only beta) releases of multitos you can also
copy gem.sys to c:\auto\gem.prg to run it without mint (if you want
color icons and other nifty stuff). This will be quicker than the
mint+gem.sys combo because the AES won't busy-wait for new events all
the time. It is the combo GEM.SYS (with AES < 4.1) + MINT.PRG that is
slow.

> I think Sim City is a great little game and so does my son who plays
> it whenever he can get me off the ST.
>
> He is desparate to know the cheat codes, especially for getting more
> money, can someone please let us know.

I've got a little utility for cheating at Sim City - don't know where it
came from. Here are the short docs...

```
============================================================================
Sim City Super Banker (c) P. Hargreaves 1990
--------------------
```

Addicted to Sim City? Is your city always suffering 'Brownouts'? Would you
really like to have that airport? Are your citizens demanding a stadium?
Would you really like to turn the whole landscape into a big park?

Well, what's stopping you from achieving all of this? It can't be because
you haven't got enough cash. It is?

Well, with the help of the Sim City Super Banker, you can put that right.

Load the Sim City Super Banker, select your Sim City save game file, tell
the program how much cash you want (the up arrow increases the cash by
10000, the down arrow decreases the cash by 1000, OK selects the amount
shown), and save the new file.

Now load Sim City, click on load city, select your new save game file, and
cash should be the least of your worries (for a while at any rate).

```
============================================================================
```

It comes to about 20k when UUEncoded. I could split it into two parts if
you want it (youhave a 16klimit on Maus don't you?)

```
*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*

M@(> Hi,

M@(> I'm interested in purchasing a used 1040ST computer. I have several
M@(> leads and I'm wondering what things I should check for when examining
M@(> the models. Any tips or suggestions would be GREATLY appreciated.
M@(> Thanks,

Well, IMHO, I would suggest you make sure that it has a Double Sided Floppy Drive to begin with. Check this by clicking on the Drive A icon, (with a disk in !) then 'Show Info' in the drop down menu. If the figures show that the total disk space is three hundred and something kbytes, then forget it. A DS drive should show around 720k.

Next, check the TOS version (Operating System). Click on 'Desktop' and you should get the TOS details, I'm not sure of the exact dates of the different versions, but if it says anything older than 1983, you are in TOS 1.0 or 1.2 territory and it's best left alone, unless it's very cheap, in which case you can upgrade to a later version with the money you save. Don't quote me on the TOS date, I may be wrong, someone will undoubtedly correct me here ! Another way to check the TOS is the Atari /|\ logo cycles thru different colors in TOS 1.4 and not in the old versions (1.0 or 1.2). I doubt if the machines you're looking at will have TOS 2.06 on them, that is very new. (and if you're lucky enough that they *do*, it will have a date in the 90's for the TOS).

Check the Mouse and Joystick ports for wear & tear, they tend to be one of the first things to go. Apart from that, I can't think of anything specific. Oh, and make sure that it *is* a 1Mb machine ! I don't think anyone would go to the trouble of desoldering a RAM bank, but if you can get hold of a PD memory checker utility, then so much the better.

Hope this helps.

3110. Internal Clock for an STe

Newsgroup: comp.sys.atari.st
Date: 1994-11-16 21:53:58 UTC
From: group1@access3.digex.net
Message-ID: <3adv1m$8cc@access3.digex.net>
Source record: 176919

Does anyone know of a clock for the STe that is internal and not a cartridge? I have a sampling cartridge that I use and don't want to take out.

3111. Atari Lynx 16-bit color portable for sale!

Newsgroup: comp.sys.atari.st
Date: 1994-11-16 22:16:47 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.843.2ECA84CF@getty.onu.edu>
Source record: 176920

I have a complete system. It is an Atari Lynx, 16-bit portable gaming system. It has a color LCD screen, with an electroluminescent backlit screen, so you can play it in the dark, wherever you go. It works with 6 AA batteries, or you can run it off of a 9v ac adapter.
This system has stereo sound. It is also a 16-BIT system, not 8-bit like the Sega Game Gear. I guess you could say that it is like having a portable Genesis with a screen. There are over 70 games available for the Lynx, and more coming out. You will find favorites like Ms. Pac-Man, Joust, Quixx, Ninja Gaiden, Lemmings, and a lot of others I can't remember offhand. There are some new ones as well, like Desert Strike, from Electronic Arts. Most of these games are available for around $20 each, from Atari or other mail order places. I will give the related phone #'s to whoever buys the system. In case you are wondering why I am only selling one game with the system, it is because I now have two! (I will need the rest of the games for my Lynx II) Oh, I almost forgot - the Lynx is the only portable game system that is designed to work with either left or right handed individuals. It has a double set of controllers, and with a push of a button the screen flips upside down (or rightside up, depending on your point of view) and you can enjoy playing left handed with the 2nd set of buttons. This isn't all that important to those of use who are right-handed, but I just thought I'd let you know.

Keep in mind that a Sega Game Gear, which has a smaller screen, (and is only 8-bit) costs $89 without a game, and $119 with a game. I would like to sell this system for the highest bid I get in the next 10 days. If I get a really good bid within the next few days, I may simply end the sale right then & there, because I don't really like auctions much myself. I would also consider trading the system for about 4 OEM CD games, but you would probably have to be a dealer or at least have access to a good selection to be able to get the ones I want. If interested, e-mail me.

I am including:

The Atari Lynx 16-bit base unit
6 new alkaline batteries (batteries included, wow!)
ac wall adapter, to use when you are near a wall outlet
and a free game of your choice!
(pick one from the following list)

Gates of Zendocon (shooter) This game has over 50 different levels! You can get power ups, have side shooters, etc. My favorite is the flying eyeball that shoots fire!

Rampage (the classic "monsters smash up the city" game) This has the original 3 monsters, plus another mystery monster you can play!

Gauntlet III (explore the dungeons, get the keys, fight hordes of ghosts, giant scorpions, the undead, etc.) This one lets you be the wizard, warrior, valkyrie, punk rocker, nerd, cowboy, pirate, and several others. Each has different attributes.

Sorry you have got it all wrong Commodore is still around, and Atari has
closed it computer division down..

So save up some money and go buy a PC clone, as I can't see people sopporting a
dying market....

3118. DBASE III files (.DBF)

Newsgroup: comp.sys.atari.st
Date: 1994-11-16 23:56:03 UTC
From: npetrlik@public.srce.hr
Message-ID: <3ae66j$6ri@nippur.irb.hr>
Source record: 176924

Hi !

I'm looking for a program which may convert
.DBF (dbase III) database file into
ascii delimited format.
I have troubles reading .DBF files
(and only program which may import
.DBF file is Superbase PRO, but he's
terribly slow ! - to import an 700K
long .DBF file it takes FIVE HOURS !).
Other program (which only read & view .DBF files)
is DBMAN , but he's only a viewer, not an
exporter or converter ..)

Please, Help !

Bye,
Neven

3119. Text Editor For Partial Loading

Hi !

Is there ANY available text editor which
prefers partial text loading ?
I mean, when the file size is bigger
than free memory.., text editor must load only
the block which fits into memory, and later
(if requested) jump to another part of file
and load him into the memory ..

Thanx for the answers,
Neven

]
] Seriously guys!
]
] Mark
]
] PS: and don't say sell them and buy 4 1 meg simms instead....

Selling them & buying the 1meggers is about the only way to do it though,
the MMU would throw a fit if you tried hooking them all up together!

Thing is, you'd probably only get about half the price of 4 1meg simms
for all of the 12 256K simms, as they aren't much use to people these
days! (Unless there's still some people with .5meg STE's!? :)

If you managed to wire up 2 SIMMs to one socket, the MMU would try
to access both SIMMs at once, so if it didn't crash, you'd probably
just end up with 1meg.

I could be wrong of course, but I'd be surprised in this case if it
was so!

] the better sound. Can you ??
] I mean the SoundBlaster and GUS .... aaahhh come on, none of them has prof.
]
] d quality. Especially not the SoundBlaster. The Falcon has. And the DSP doe

Never heard of the GUS, but the more recent Sound-Blasters can record
& playback higher quality sound than the Falcon can, admittedly,
kitting up the machine with all this would not be cheap.

However, don't expect to do much with the sound other than record & play
it, as without a DSP, you'd be waiting for quite some time!

The high-end 16 bit soundblasters can do 4-channel 50Khz, 16-bit
sound, and the most recent one (Not sure if it's released yet), will
do roughly the same in 32-bit quality. (Overkill, who is likely
to notice!?)

I use usually 25Khz, 8-bit, Mono samples on my STE, mainly because it's
the only thing that the software & cartridge together can manage. But
it sounds great. Sampling it at 50Khz, 16-bit stereo, isn't really
worth the extra space it takes up, as the quality isn't four times
as good, which is roughly the size increase. Around 40Khz, 16-bit
is as good as you're likely to need. (Which is approximately CD
quality, give or take a bit, 41.7Khz, 16-bit Stereo from memory).

PC's have never been used for serious sound as such, it's been left
to the others. (Atari, Mac' etc.) But, throw enough money at them,
and it'll get there! :)

Missions ? I played this game for ages a while back and never had to
go on any missions. I'm obviously missing something. It might be the
spark needed to get me to try the game again.

Pointers please .....

Excessive: You could make a tightly coded Quicksort with a module for compare, and another for swap, but instead, you make a bubble sort that puts everything together, and has redundant code. Due to the modularity, the quick sort would be MUCH faster and turn out smaller. Instead, you didn't want to think, and threw together a bubble sort.

Excessive: You have to write blitting code. You could think about the problem and write a small, fast routine in assembly, but instead, you write it in Pascal and take the laziest approach. It ends up much bigger and MUCH slower.

Sure, writing an OS in C is fine. However, you need to actually think about what it is that you're doing, and develop your critical code in assembly (ultimately... prototypes done in BASIC would be fine and very helpful). Then you use those low-level modules to build more complex modules that you write in a higher level language and where the processing in C and the function-call time is not critical. If the problem is conceived correctly, the code will not turn out to be a huge, slow mess.

Of course, not everything has to be optimal. For example, in my AF, I have a routine which closes all windows. I COULD traverse my linked list and close them all in that routine. However, I have another routine which deletes a specific window and it's used more often. So, my close_all routine keeps calling my close_window routine, telling it to close the window which is the head of the list, until the head of the list is NULL. Either way, neither routine has to be particularly fast

because window manipulation of that sort isn't done very often, and the
OS calls themselves take far more processing time than any of my code.
So, I save space AND development time by (perhaps inefficiently) reusing
already existing routines.

In fact, things like this happen all throughout my AF. I considered all
the low level things first, and then then built on them. When I
discovered that there was something repeated, potentially useful for
other purposes, or something I'd forgotten, I ripped the code out,
generalized it, and made it into a seperate function.

> the Norton desktop was *much* faster. I like both machines, Atari and PC.
> I think Windows with just the Program Manager _sucks_. Thats why I use
> Norton.

Depends on your view of 'fast'. A Mac Quadra can redraw the contents of
a window MUCH faster than a Falcon, for example, but there are delays in
the user interface (flashing of the menu selection, zoom effects for
opening/closing windows, timed software delays for UI effects, etc.) that
make some of the more important parts (like instant responce) unbearably
sluggish to work with. This is a psychological problem. When I make a
selection, I want the system to react instantly. When the system is
doing actual work, I'm distracted by watching the work being done. The
Mac may take less time overall, but the delays where the system does
nothing are quite obvious and irritating.

Now, Windows doesn't have many of these INTENTIONAL software delays... or
any at all that I can perceive. On a 66mhz 486, Windows 3.1 is actually
quite fast. Aside from the fact that I simply don't like the style of
the user interface, there are delays in windows that are due to a
combination of consistently poor video hardware and poor programming.
Now, considering some of the FAST stuff I've seen done with standard VGA,
I would have to say that much of the sluggishness if due to poor
programming.

Consider a typical session in Windows, using Word. I choose Word because
I like it, and because it's a good example of a nice Windows application.
I have to CLICK on a menu title, and then it takes a humanly observable
amount of time to first draw the frame for the window, and then fill it.
Then I click on a selection. The menu instantly disappears, but what's
behind it doesn't get instantly redrawn. Over another observable time
period, the portion obscured by the menu is slowly redrawn by the

application, first the toolbar, then the ruler, then slowly, the text in an already open window. Next, the file selector pops up (because I wanted to open a file), first the frame of the window, then the objects in the dialog appear one by one. The disk is accessed and after another of those observable units of time, the file names finally appear. Using the dialog (file selector) isn't that bad. When I click on a filename, it highlights with unnoticable speed. Of course, if I want to select a different wildcard, I have to click on the box and wait for the pop-up to appear, select it, wait for it to disappear, etc. When I click on the OK button on the dialog, parts of the window contents disappear, then the rest slowly are overwritten when the application slowly redraws its window contents. The new windows appears. The borders instantly show up, but Word has to take a moment to draw the contents. No big deal. As I edit my new document, it isn't that bad. It's not too jump, and I can get my work done.

Now, the above is a bit exaggerated for a 486, while it's very generous to a system like a 25mhz 386 with 4 megs of RAM. But considering that the 386, although horribly designed, it NOT a particularly slow processor. Your average DOS application, even using graphics, will fly on a 386.

Now consider a typical session with Atari Works' WP. I choose this because I hate it and it's an awful example of an Atari application. I move the mouse to the File menu and it instantly pops down. I select the option, and the menu instantly disappears with the stuff behind it being restored at the same time. The disk is accessed for a relatively short period of time (even for floppies), and the file selector appears on the screen. It's not instantaneous. You can tell that things are being drawn on it, rather than it magically appearing, but it's much faster than the Windows thing. I select the file and click OK. If it's UIS, what was behind the selector instantly reappears. Then the new Window opens, the borders appearing instantly. If I use the Atari file selector, it takes a moment while Atari Works SLOWLY dedraws the window contents, line by line, making awfully inefficient use of the capabilities of SpeedoGDOS. First the top window, and then when I don't care any more and I'm paying attention to other things, any unobscured portion of a background window is slowly redrawn, if necessary. Typing is awful. Things take forever to update, and Works has weird design flaws like Shift-Backspace deleting the whole line before the cursor... what if I'm typing in all caps and I hit BS? Boom! And then there's the Ctrl-A. Now, Ctrl-A for select-all on a PC makes perfect sense, but on an Atari it's lunacy. Ctrl and A are right next to each other and the Atari keyboards have too little inter-key spacing (the caps should taper up to a slightly smaller size). Too often for comfort, when trying to hit A or Control, my weak little finger will slip and hit both keys. Since I would naturally be in the process of typing something, I the next thing I will hit is another key, thereby wiping out my whole document and replacing it with whatever is left of the word I word I was typing, following the A.

What does this suggest? Looking only at the OS's part of each ordeal, Windows is taking a much less efficient approach to dealing with Windows, dialogs, and menus, albeit quite often more flexible. For a menu, the Atari's is an object tree that gets drawn. On Windows, it's actually a window that contains a dialog. On the Atari, what's behind the window is stored in a buffer. On Windows, what's behind the window is redrawn by the application in the same way information is redrawn after any window is closed. On the Atari, the file-selector is modal, while on Windows, it's not (which is good), but Windows' method for drawing and handling dialogs is awful and crawls compared to my own code for doing amodal dialogs. Secondly, an Atari can pull up a directory from a disk almost instantly from an HD, regardless of size, while, for some odd reason, Windows (and even DOS without Windows) takes an unusually long time. Lastly, Atari makes window redraw requests in order of top-down so that your top window has been restored and you think you can go about your work, even though the other windows still aren't drawn yet. Nevertheless, you're fooled into thinking that you can, for example, make another menu selection, and by the time you get the mouse pointer back up to the menu bar, the drawing is finished. Windows, on the other hand, seems to do it in some random or merely unoptimal order, as well as having slow facilities for doing the actual drawing.

Another reason for Windows' sluggishness is that VM is done very poorly and is a major bottleneck in the system. If things weren't so damn large, we wouldn't need all that memory (most of which is filled by Windows itself and NOT applications), and, in at least that area, Windows would be a lot faster.

I'm QUITE certain that my AF is not nearly as advanced as some of the others for the Atari. It's something that I think is ellegantly designed, but applicable to only myself because it contains only what I

want in it. I don't have to make is mega-powerful and flexible because
I'm not worried about someone else wanting some other feature that I
don't have, and when I need a new feature, I have the source so I can just
add it.

I do not argue that other systems are more flexible and more powerful. I
am pointing out the other drawbacks in the systems, why I don't like them,
and why my Atari does it better. But development and use are two
different things. You may be able to develop a Windows app in minutes,
while it may take me 1/2 hour to do the same thing. Without optimization,
I'm sure that mine would be more efficient. Not necessarily faster
(because of processor speed differences, but that may not be fair,
especially when the Atari would be faster than the PC if they were both
running at the same clock speed), and not necessarily easier to use (aside
from personal preferences about UI style), but more efficient in design.
Additionally, it runs under an OS that is efficiently designed and not a
bottleneck to the apps running under it.

> machine/environment?

Well, the difference between 50 bytes and 100 bytes is not as profound as
the difference between 500k and 1 meg. Assuming that you could optimize
both to get to the smaller ones, optimizing the 100 bytes isn't as
important as shrinking the 1 meg, especially when the code COULD be
smaller. On the other hand, if that 1 meg is composed of many
optimizable 100 bytes units, then you should optimize them.

The difference between the 800 and 1040 is this: When you're DOING MORE,
it's ok to get bigger. When you're being a lazy dork, it's not. Of
course, cutting corners and making something a little inefficient isn't
always laziness, but we should not be excessive about it, and certainly
not when writing an OS.

> I can't understand why people think that this is the result of some
> MS/IBM/Apple conspiracy to make bloated OS's.

No, not a conspiracy. Well, yeah, there is to the extent that they don't
want to write good OS's, and as a result of THAT, they use the media to
get people to THINK that buying more and more and more and more hardware
is fine and necessary, when in fact, it should not be. The root
of the problem is that they just don't want to write good code.

> There is a reason
> for memory requirements to grow with capability.

Definately. If a program has more power and it's larger, fine. Program
size should grow because of increase in capability, NOT because

programmers figure they don't have to worry about size constaints and speed limitations.

With this new PPC and the falling prices of memory, developers are NOT going to spend their time writing good software to take advantage of the system. App and OS developers are going to believe that since the CPU is 10 times faster and the available memory is 10 times larger, that writing code that is 10 times bigger and 10 times slower is acceptable. The idea behind getting a faster CPU is so you can run all software at a faster speed, NOT so that you can run the new software as a normal speed.

The problem is that there is an undeniable trend toward ABUSING your system resources, rather than taking advantage of the extra resources for added power.

> There is a reason
> why the number of titles for each OS has grown wildly beyond that
> of the entire Atari base over it's entire lifetime.

Yeah... Atari management was clueless, didn't know how to market a good machine, and let it die. If Atari had had good management, they would have keep their machines beyond the capabilities of competitors (every time they came out with a machine, it was better than much else with a comparable price, unless it was late like the Falcon). By now, their OS would probably be no larger than a Meg, but it wouldn't matter because most of it would be in ROM, so it takes up no significant amount of disk space or RAM. Additionally, it (or it with various additions like NVDI) would be smaller and faster than competitor OS's.

> The 400/800

> boundaries. ST 1Meg, PC 4-8 Meg....See a trend? Either the entire
> race of programmers is sliding into a comatose or the cost of
> productivity and advanced capability is resources.

The cost of advanced capability is resources. The cost of productivity is effort, something that people don't like to put forth. Not all programmers... just the ones from Microsoft, Apple, Borland, WordPerfect, and countless others that hold the Dollar as more important than ETHICS.

Microsoft's marketing is very unethical. They take stuff which they know to be flawed, slow, overly bloated, and poorly designed and promote it as some wonderful new thing, selling it to millions of stupid Americans who hardly know how to turn on a computer.

But unlike what you suggest, I do not concern myself with my boundary of 4 megs in my Falcon. It is the most advanced Atari computer with a number of multitasking OS's available for it (some better than others). I have never run out of memory. Yet, people with 8 megs in PC's and Macs often find themselves dealing with memory limitations.

> That's OK, as long as
> the resource costs keep up or outpace, which they have. IMO having a

> copy of Mosaic running under Winsock is worth 4 megs as opposed to
> having the TT that _can't_run_Mosaic_at_all_.

The declining costs of resources should be an advantage, not a
necessity. The laziness of Microsoft is FORCING us to buy more memory,
faster CPU's, and larger hard drives. I shouldn't NEED 8 megs of RAM
just to run a WP. I shouldn't need to keep buying resources merely to
keep pace. This is an OS we're talking about here. I should only want
more memory or speed if I'm running software that intrinsicly requires
that much, like ray-tracing or regression modeling of huge data sets.

If someone wanted to do Music or DTP, I would still recommend an Atari, because there is nothing that beats the array of MIDI software for Atari, and there is nothing with can compare to Calamus SL... well, except Calamus NT, but to run that, you'd spend a fortune. Also, if someone wanted a nice development environment that didn't make them put up with all the crap that Windows, X Windows, System 7 and others give you, I'd recommend an Atari. Also, some of the graphics manipulation software is quite excellent.

Unfortunately, the best machine for WP and Spreadsheet and other kinds of mid-level production is the PC. Software for Atari that is worth considering is usually far too high-end for the average user. For example, many Atari users don't want to put the time into learning Calamus SL to see how powerful it really is. It takes effort (hmmm.. effort.. there's that word again).

Fun discussion about software engineering philosophy. Keep it coming. :)

: >: Obsession is nothing like the Pd game Starball. Obsession has a lot more
: >: features including top quality stereo sound, graphics which are superior and
: >: also a ball which obeys the Newtonian Laws of Gravity, not Starball gravity.
: >:

: I have to disagree here and say that I consider Starball to be technically
: a better game than Obsession. I saw Starball first, and when I came to play
: Obsession this is what I thought.

: 1) Major gripe - the ball seems to be just superimposed on the playfield, a
: plain un-involved bitimage. The reason (IMHO) that Starball's ball seems
: to fit better is that if you look, there are lines on which are animated
: to give the illusion of a rolling ball.

: 2) Size. The playfield on starball is MUCH bigger, there simply isn't enough
: of the table in Obsession.

: 3) Graphics quality - the main playfield in starball is much better drawn (ok,
: some of the bonus screens are a bit cheesy - esp. Llamaball, but I think that
: was the intention).

: 4) Scrolling is comparable on both, but Starball does have a lot more going on
: besides a scrolling playfield (invaders, etc) which makes it technically
: more impressive.

: 5) Obsession is closer to a Pinball table than Starball, simply because of
: the above (4). But it doesn't have the depth of play, as the number of bonus'
: available is very limited.

: 6) Attention to detail. In Starball, a lot of work has gone into the little
: details like the bumpers at the bottom (they flash when hit, get gradually
: more rugged, then explode). The little details like this are missing from
: Obsession - if it is intended to be a top class pinball game, then small
: things like ensuring that a rubber bumper will give a bit, then kick out
: as a ball is pushed away would have improved what is currently a very static
: feel.

: Both are good games, but it is a shame, that Obsession didn't get that little
: bit extra as the chance was there to make a damn fine pinball game.

: >: Please do not compare Starball to Obsession, it is a bit like comparing a Mini
: >: with a Merc.

: Not really, as Starball has the trimmings, more a sort of Rover 620 with a base
: model Ford. Both are sturdy built, and do the job - but the Rover has the extras
: that make a real quality product. (Rover==Starball, Ford==Obsession).

: >And you wouldn't be just a little bit biased at all... would you? ;-)
: >For what its worth Starball is a completely different game, just coz they

: Yeah - it's a shame, 'coz although Starball is great, it would have been nice to
: have a definitive 'pure' pinball game as well.

Sorry for quoting all this text, but I have to correct you on several
accounts here....

I'm a coder, and I know very well what is hard to do, and what is easy to
do, and there is _NO_ doubt whatsoever that OBSESSION is the better game.

1: the ball in Starball moves very unrealistic, compared to Obsession.
More math involved in obsession = Technically better.

2: Better graphics in obsession, (more cols), better than starball.
(Better graphics consumes more memory, thus smaller board)

3: Better drawn?!? Are you colourblind????

4: "more going on" are you on drugs? Compare the graphics quality!!!

5: You're correct, but do you want a shot-em'-up or a pinball game?

6: How do you rate games? You're like that lamer in a magazine I
recently read, who rated modems by the number of diods on the front!

Regards, Tommy

: RATSOFT....RATSOFT....RATSOFT

: I would recommend Ratsoft. Call my board at 909-621-3737 and see Rip graphics
: on an Atari board! The authors BBS is 909-481-1927. The author is Steve
: Hughey. I bought the BBS package over a year ago and there have been at least
: 12-14 updates...one a month...not just bug squashing either...online spell
: checking, RIP graphics, Internal Fido Messages, Forem Dat files, Full Screen
: Editor Online, Auto file_id.diz extractor, a very nice BBS package. The best
: for the Atari. Runs on all Atari with 1 meg or more and cost a meager $90 or
: so. Supports all serial ports ever made for Atari....

: My second choice would be Transcendence, but it costs almost as much and has
: less available for it as fa as add ons go.

Speaking as a calling user to RatSoft boards, I must say that it is the
best I've ever seen.
I've been calling boards for over 7 years now, and I have never seen a
BBS-system that is as good as RatSoft.
(I'm calling and have called systems for Atari/Amiga/Mac and PC, and my
current setup is F030 14/330 FPU and 486DX2/66 16/1gig tapestreamer etc)

: months for my Falcon to arriv, I don't want to destroy it... :-)

: I also want an accelerator (Preferably one with fastram ("TT-ram")), which
: one's the best? And most importantly, *where* can I get one? I'm not very
: interested in the Speed Resolution Board, as I've heard you have to modify
: the Falcon motherboard a bit. But if anybody have fitted this accelerator
: themselves I'm happy to hear from you.

: A last question: Is it possible to *remove* the RIAA-amplification on the
: microphone-input? I *don't* just want to reduce the gain, I also want to
: remove the bass boost and the phantom power.

Yes, yes, yes, to all your questions!

I have a Mega ST keyboard connected to my F030, is just as easy as
connecting it to a STE, the only thing to think of is to connect it
exactly the same way as the original F030-keyboard, since there is an
extra pin on the keyboard-outlet.

About accelerators, well, I'm personally not very fond of all those
"fake"-accelerators out there, all they do is to double the CPU-clock,
and who knows how long that will work?
Get an accelerator with a CPU on the expansion-board, Mighty Sonic for
example, it costs a little more, but it is worth it, you get a 32 MHz
68030 and the ability to have TT-ram, the only thing missing is a 32MHz
FPU socket.

Yes, it is possible to disconnect the bassbost and everything else on the
F030. It demands a little soldering, and unfortunately I don't know how
to do it, so wait for an extensive answer from someone else here.

Some of the older modems have Dip switches or links so that you can force
DTR on all the time...

Most Comms programes use DTR to drop the line, (connection), so have a look
at your modem manual, there are software straps in later modems, have a look
at the AT&Dx/&Qx command in your manual....

I am using NeoDesk 4 and am quite pleased with it. It seemed initially to be somewhat cumbersome after NeoDesk 3, but I have broken it in, so to speak, and it is as versatile and useful desktop. I run MagiC as OS with Overscan. I use Neodesk 4 in its own window with a colored tiled backdrop for a 'Windows' look with an Atari feel. There are other pluses such a 'Group' windows, color icons, background file operations, and more. I have yet to try Ease (There's a demo at micros.hensa.ac.uk) but I have heard that it (At least the demo, lacks a wealth of features.

Best wishes,

I asked this on the net some weeks back, what are the good points
of EASE, with reference to say TOS 2.6...

So far no one reponce here at all, but I have been told that EASE is in GERMAN,
not good for all those English people out there...

There is a Demo of EASE on Hensa and a Demo of Neodesk 4 on some sites
like A.A....

I could not see any good points from the Demo, but then I could have missed
some thing being its GERMAN....!!!!

>can I get it?

The only _software_ emulator for Atari is/was PC-DITTO. It works reasonably well but is obscenely _slow_! A better bet would be the AT-Speed hardware emulator which I've seen advertised recently at greatly reduced prices. Try Toad Computers or look in the latest mags for the discounts. It should run about $150 for the AT-Speed. In an ST/STE you may have to go to an external keyboard setup to fit it in the case. It sits perfectly inside my Mega 4. ;) Oh, and the folks who did PC-DITTO are OOB, but you could pick a copy up used for a few dollars (Hell I'll sell you mine if you want).

IC>JH> lost it. I am interested in getting the new version.

IC>Rich Tietjens should have the new version tomorrow. Maybe he can pass it on
IC>to you.

Got it, passed it to Terry May for hatching in AtariNet. As soon as my
local IN server gets ftp capacity, I'll send it up to Hensa and Mickey
Boyd.

IC>Anyone who can tell me how to do File Transfers To/From a FidoNet point,
IC>please do so!

That's a toughie. You _can_ send uucoded mail - but if you route them,
you're going to have a lot of unhappy Fido sysops along the path. If
you have an Internet gateway system close by (local dial, that is), and
you apparently do, then you could uucode the files via IN email.

3140. MAGIC and NVDI

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 08:38:27 UTC
From: grillo@olivea.ATC.Olivetti.Com
Message-ID: <3af4q3$2ub@olivea.ATC.Olivetti.Com>
Source record: 176946

I'm planning to upgrade my STFM (Tos 1.4 4Mb 400 Mb Hdu) with NVDI, but
I'm very intringued by Magic that seems to be a TOS replacement promising, other
than multitasking, more speed too.

My questions are: Do they work toghether ? Is there any benefit running both ?

I understood that NVDI is primarily a GRAPHIC accelerator, what Magic will speed up ?

Bye

3141. Re: HSMODA04 doesn't work with Stalker 3?

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 08:41:33 UTC
From: blade01@pplnet.com
Message-ID: <5949IIEPKTWYPOGUPQ@pplnet.com>
Source record: 176694

IS>No, not GFA-BASIC is crap in general, but it's possible to write crap
IS>with the help of _any_ language.

True, but it is especially easy with GFA because of the direct-to-OS
calls used in some of the routines that bypass the "official" vectors.

IS>> However... Using GEMDOS calls to cauxos under HSModem _always_ produces
IS>> a "port is ready to send" response; under TurboCTS, handshaking does
IS>> work. Now, if there were a complete English explanation of how to make
IS>> HSmodem handshake properly under GEMDOS, or if the default setting would
IS>> do that, there would be no problem.

IS>Sorry, but I think you didn't read the SERSOFST.TXT and the other texts
IS>carefully. Because "AUX" is crap (I believed that nobody used it in the
IS>past because it produced additional overhead over calling the BIOS Bco*
IS>directly) it isn't supported. Open a "U:\DEV\MODEM1" if you like to
IS>use MODEM1 and it will work. AUX is crap eg because the assigned BIOS-
IS>device could be changed via Bconmap.

Let's see, now, you're suggesting that I should run MiNT, as near as I
can see - add another layer of overhead? I will assume that because it
is 3:00 in the morning here, I am misunderstanding what you say. If you
would please clarify - you think I should essentially give up on all
software that uses the AUX: port? Or switch to MiNT if I want to keep
that software?

IS>Sorry too, but I'm even not payed for doing what I do. And I need the
IS>feedback.

This is true.

IS>> How about a backward-compatible mode or driver for people who don't
IS>> wantto replace ALL their software just to support the "new standard"
IS>> method? Since the old way worked - and the only reason I had to switch
IS>> to HSmodem was to support Semper - it would appear that the "standard"
IS>> is another non-standard change.

IS>Backward-compatible, what do you mean? All BIOS-calls are still supported
IS>(and became much faster) and they may be mixed with GEMDOS-calls without
IS>problems (but it's not recommended).

IS>Because the AUX was very bad, it wasn't supported (and if I should support
IS>it, you will have to do a Fopen to AUX, using only -2 Handle without
IS>Fopen would create to much trouble with other programs). If there are
IS>many american or english programs using this, how shall I know about it
IS>if nobody writes a mail.

There are buttloads of American programs doing exactly that.

IS>In Germany there are sold only very few non-german communication
IS>programs. (I don't want say something about the possible reason)

How about "they don't come in German versions" as a reason? It's
perfectly normal. Hmmmm...

After I complete translation of the BASIC language used, would you care
to translate the English to German for the next version of ST-Keep?

Which leaves me with my original problem - either I give up Semper
(which is paid for), or I give up most of my other software (also paid
for); unless you are willing to write an AUX: driver for HSmoda4 (and
obviously that's asking a lot - and frankly it's beyond my capability at
this time, or I would do it myself).

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 08:53:27 UTC
From: blade01@pplnet.com
Message-ID: <6663SWSDUIQVXSPVWI@pplnet.com>
Source record: 176949

IW>??? AFAIK RTS/CTS handshaking is between DTE (computer) and DCE
(modem),
IW>not between local and remote modem. Could you please elaborate?

I'm not sure of the correct terms, but obviously both the modems must
communicate the need to wait, the OK to send, or the request to resend.
When the modem is in fact waiting on the OK to send, and the port
driver software insists that it is OK to send, transmissions become
garbled.

IW>And what exactly do you mean by `the software ... will not use the
IW>handshaking HSMODA provides'? AFAIK HSMODA will use the handshaking
IW>that your software instructs it to use (i.e. the handshaking is
IW>implemented in the driver, not in the application).

Quite simply put, even when it is clear (from the idiot lights on the
modem, and the munged screen on the remote terminal) that the BBS modem
is not ready to send, HSModa4 says it _is_ ready (Function cauxos%
returns a -1, meaning Clear To Send).

I do not claim to know enough to write my own serial routines (if I did,
I'd go ahead and do it), but I do know that TurboCTS works with all my
"other" software, while Semper will NOT work with it. I'd call that a
problem.

Microsoft's operating systems are not perfect, but they are far
from "awful." I find it difficult to believe that Microsoft's selling of
its operating systems being "due to stupidity" and "selling crap to idiot
americans." I rather find it more likely that you are out on a lunatic
fringe. I suppose you'd attempt to reason that Microsoft's stupidity has
made their name a household word and made the PC architecture by FAR the
world's most popular - and $9 billion for Gates. Yes, I'm sure you're
correct....Microsoft is a fledgling company based on stupidity....ha ha ha!

Neodesk4: doesn't understand long filenames, allegedly buggy, won't work under MagiC.

Ease: doesn't understand long filenames, very nippy, works fine under MagiC, slightly low on features.

And you missed:

Gemini 2: understands long filenames, works fine under Mint/MTOS, built-in shell, and FREE!

You can pick it up from hensa (Cue Danny!)

From: vctec@westminster.ac.uk
Message-ID: <CzEqJI.CyA@westminster.ac.uk>
Source record: 176805

Hello everyone.

MiNT 1.12 has now moved out of incoming/atari-mint. This incoming
directory is for moderators only, and is not world readable. However,
MiNT 1.12 is now in the main file area. :-)

This has now been moved to micros/atari/mint/a/a050/

The files are:
mint112b.zoo -- binaries
mint112d.zoo -- documents
mint112s.zoo -- sources

You may access us via ftp, telnet, PAD, and gopher
WWW access is at http://micros.hensa.ac.uk/

The best way to access us is via gopher and WWW if you have access to
these
services.

Regards
Danny

:-) Thanx Chris.

Gemini you may get from micros.hensa.ac.uk, in the path
micros/atari/tos/o/o018/

There are four files in this directory....and a .MSG file describing
what is in the directory.

English version out soon, for which you will have to register (not
much).

>
> My questions are: Do they work toghether ? Is there any benefit running both ?
>
> I understood that NVDI is primarily a GRAPHIC accelerator, what Magic will speed up ?
Sure they work together (since NVDI and parts of MagiC are written by the
same authors). MagiC already has quite fast screen-routines, but NVDI isn't
just a simple screen-accelarator, it also includes a complete GDOS (and,
with NVDI 3.0x, supports Speedo- and TrueType-fonts). So just get both, you
won't regret it...

Ciao

Thomas

Hello,

Has anybody got information about a Atari ATW800 transputer workstation ?
Is it worth while to buy one ? I mean, any positive experience? Where can I
get the Helios operating system (close to the Netherlands of course)?

Thanks in advance,
Ids

Please reply with E-mail:

3157. Calligrapher III major slow down.

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 11:02:06 UTC
From: mcsse2sw@dct.ac.uk
Message-ID: <1994Nov17.110206.1@dct.ac.uk>
Source record: 176822

Has anyone encountered a major 'slow down' bug in Calligrapher Gold III?
Occasionally, happened about four times, Calligrapher suddenly takes a
nose dive and takes about six seconds to display each character typed in.
Saving then takes about two minutes and Quiting takes about a minute. :-(
The only way to fix this is to re-boot the system and begin again. Does any
one know why this happens, and possibly how to avoid it?

Thanks.

3158. Handling VA_messages in GFA

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 11:06:30 UTC
From: ceebsm@cscd4c12.caledonia.hw.ac.uk
Message-ID: <CzEs6w.9Kt@cee.hw.ac.uk>
Source record: 176815

Hopefully one of you GFA experts out there can help me with this on
this question:

If I have a program running under MagiC (v 2.10) and I drop a file
onto that program's icon on MagXDesk how would my program be able to
find the name of the file being passed to it?

I have an EVNT_MULTI() loop running which receives the VA_START as a
message but where do I find the file's name from?

Any help would be gladly received, but don't point me to ST-Guide's
VA_ pages or Gemini as they don't seem to help me!

Cheers,

Barry

3159. Compiling MiNT with Lattice C 5.52

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 11:11:03 UTC
From: ceebsm@cscd4c12.caledonia.hw.ac.uk
Message-ID: <CzEsEH.9o4@cee.hw.ac.uk>
Source record: 176816

Please help me!!!! I am trying, like a fair number of people I would
imagine, trying to compile MINT 1.10. I am using Lattice C 5.52 and
have installed the MintLib 4.4 files for Lattice and also header
files.

When ever I try to compile the Lattice PRJ file I get lots of
these errors:

```
typedef struct kbdvbase {
^
mint.h 200 Error 63: duplicate declaration of item "kbdvbase"
long midivec;
^
```

[I have not included them all as this would take up too much bandwidth!]

I have pre-compiled the MINT.H file to create MINT.SYM but where do I
go from there????

Any help, ie. step-by-step instructions would be helpful!

Cheers

Barry

Ps. I am compiling on a 2Meg STE if this makes any difference.

Hello UK!

As you will have probably read, there are two Atari ST Review
shows on the 10th (Birmingham) and 11th (London) of December.

We're wondering whether to turn up in person to promote our
music editor StormTracker and could do with knowing the number
of people going to the shows?

Just a quick question or two then,

Are you going to either show, which one, and why?

Replys preferably by mail to dxo@cs.bham.ac.uk

Thanksalot,

David

Agree 100%! That's why I recently bought a 486DX2/66. But I will never sell
my atari ST! I know this machine inside out, and still enjoy very much
writing GEM applications. But there comes a time you want a faster, newer
machine. And it never entered my mind to upgrade by buying a new atari:
too little support and way too expensive. I think I will be quite satisfied
with X running on my 486. no atari can compete with that. :-(

On Monday November 14th at about twenty-five past eight
wells_s@ix.wcc.govt.nz (*Steve Wells*) happened to write:

SW>MiNT is the multitasking piece of Multi-TOS (hence the slow speed),

What?

The GEM.SYS ans its AES is the multitasking user-interface and the slow part.
You can run MiNT under a normal single TOS and you'll hardly notice any
difference. Except the memory it occupies.

>

Do whaaa? Errm, may seem like a stupid question but playing
Frontier using practically icons would be a tad annoying. I use
a mixture of icons and keys on the ST versh. In any case what about
engine off thrust controls without which combat would be tedious.
I suppose one would have to use the other joystick/padstick or
whatever which could get awkward, or are there more than one joystick
button for seperate operations?
Admittedly I don't know too much about the JAG except the
64 bit whizz machine beats the crap out of any other rom slot games
machine, for speed, graphics 'n sound.

It's about time that someonet kicked Master Brahbam's butt in to
improving the game by adding more atmosphere, like more interaction with
other spaceships over the radio lines, or combat missions where mass battles
take place. Actual implementation of Alien contact, Thargoids for eg. You
know, something of an adventure element, with many intelligent ships roaming
around. Joining pirate groups.Suns going supernova with rescue ops like
in the 1st Elite. Discovery of super weapons like the original
cloaking device or Ecm jammers.
Blackholes. Liven it up a bit. The Code can be no more than
600K unless its packed in some way. One can cram at least another
300K more into the machine.
So the thing comes on two disks. So what? Price of a disk
these days is minimal.

Does Mr B. have an E-mail add.?

Source record: 176824

I've recently bought myself a second hand TT, and was mildly surprised to discover that they don't have a blitter. My question is, can one be fitted, and is it possible for a non-techie like myself to do it (i.e. no soldering)? If I do fit one, will it then be possible to play the generation of games such as obsession and Zero-5?

Can anybody help?

Thanks, Tom.

Then take off your blindfold. People are supporting the Atari Market because it isn't dying here
in Europe. Atari provided us with the hardware and its up to the user base to ensure its survival.
To those that choose to jump ship through disenchantment 'good riddance'.

The (x86) PC clowns position is entirely due to corporate purchasing based on the IBM connection
and the old adage that 'no one got fired for buying IBM'. The PC clown market is now a running
under a momentum of it own and doesn't need my help.

Many people refuse to buy x86PCs for personal use as a point of principal. Those of us who attend
this forum have obviously decided that the Atari family is to our liking. If the Atari is not to your liking
go and join a forum that is.

: I have a question concerning some Demos i've been trying to run
: unsuccessfully as of late. They are the Humans Demo, Plastik, Knockout
: and the latest is the obsession pinball demo. My problem is the same
: for all.
: When i load the demo, the screen display is all garbled. Now i realize
: that some of these demos may be RGB and will not display on my system.
: Most of : these do not have any file stating the video attributes. But
: i became suspect : today when i loaded the obsession demo and witnessed
: the same problem. Only : this time the read.me file states it will work
: on either RGB or VGA. So now i'm : stumped. Is it the Demos or The system.
: My system consists of a Falcon 030, 4 meg ram, 270 mb HD and a SVGA
: monitor.

First things first.
Plastikk vibrations (or indeed Plastic Dreams) are both RGB only. They
will not work on VGA or SVGA displays. The Mugwumps superb Cycedelic
Knockout demo will work fine on SVGA and RGB but your SVGA will have to
be able to sync up to a pretty decent speed, not sure what though. To
run Knockout you must have NO acc's in memory or CPX's or Auto programs.
Best thing to do is hold down CONTROL as you boot to clear memory and
avoid the Auto folder. Then switch into a 80 column resolution, now run
the knockout demo and all should work fine. When you switch into 80
columns remember to hold down the CONTROL key to avoid loading any ACC's
you may have in your system directory.

The Humans demo is I am sure is RGB only, I will check my PD library
tonight for you. You really are not missing that much though :-)

Obsession is most certainly RGB only, it fails quite miserably on my VGA
but it may work fine on the more advanced SVGA monitors. Also never run
NVDI or Warp before running demos, they will often not accomodate this.

Hope this helps, if you want any more falcon demo info let me know. I
stock to lot :-)

The Obsession demo does run on my cheapo Ultra VGA monitor, but I have to
twiddle the controls to get get it to sync correctly...

cm3hirjd@bs47c.staffs.ac.uk (Requiem) writes:
>The Humans demo is I am sure is RGB only, I will check my PD library
>tonight for you. You really are not missing that much though :-)

I wouldn't say that....
The humans demo may not have the best graphics or sound technically, but
most important is that it is *funny*, not just a bunch of polygons
spinning around.
You can have a technically brilliant demo (or game for that matter) that
is really boring to watch/play.

Having said that, Humans is not the *best* demo in existance.
(That probably goes to Spacejunk)

BTW I thought Spacejunk was going to be released as a game? What happened
to it?

From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <CzEzBE.5Ft@exeter.ac.uk>
Source record: 176851

I am getting increasingly frustrated with running out of memory on my
4Mb Falcon 030. Is there anyone out there using a virtual ram driver
on the Falcon? If so, can you answer some questions...

1) Which driver?
2) Commercial, shareware, freeware?
3) Demo available?
4) *IS IT STABLE*???

I have tried the demo version of outside and find it to be unstable
in the extreme, and has a major paging fault...

|> I've recently bought myself a second hand TT, and was mildly surprised to discover that they don't have a blitter. My question is, can one be fitted, and is it possible for a non-techie like myself to do it (i.e. no soldering)? If I do fit one, will it then be possible to play the generation of games such as obsession and Zero-5?
|> Can anybody help?

The TT does not need a blitter, the CPU is fast enough, at least
faster than the blitter that was used in the MEGA ST's.

Source record: 176860

With the release of PONG2K_3 version we have gotten rid of the irritant bug that version one (PONG2000) had with VGA monitors. We have tested it on a TTC1434 Atari monitor that runs at 71 Hrz Freq, and all sprites are correct now. I will upload the new version to all archives I am able to. Please spread the news about this new version.

Joost.

P.S. PONG2K_2 is already fixed for VGA at 60Hrz freq.

3183. Hardware for sale

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 13:57:30 UTC
From: avp@cs.mun.ca
Message-ID: <1994Nov17.135730.13045@cs.mun.ca>
Source record: 176893

I have the following Atari stuff for sale. All prices
are in Cdn$ and include shipping. The exchange is about 75% to
US$ (approx) (i.e. 100$Cdn = 75$US)

SLM804 $325
Mega 4STe $300
Mega 4ST
(with Overscan Mod) $250
ICD HD Box
w/ 85 & 50 Meg HDs $300
SM124 Mono Monitor $100
SC1224 Col Monitor $150

Some of this can be mixed and matched, espaecially the HDs. The
50 Meg originally came in the STe, and could go back there.

Feel free to make offers.

From: lho@galaxy.ee.rochester.edu
Message-ID: <3afric$dln@galaxy.ee.rochester.edu>
Source record: 176861

Some parts for sale:

Atari SC1435 14" color monitor - $110 + shipping

Thomson 12" color monitor (including cable for
the ST, no internal spaker)
- $60 + shipping

Atari 520ST with 1 meg of RAM and external floppy disk drive
(no screw for the case)
- $75 + shipping

DEC 100 meg internal SCSI hard disk + Seagate 45 Meg internal SCSI
hard disk (both 3 1/2" half height) - $100

Atari MegaSTE 1 meg RAM, no hard disk (but scsi adapter included inside)
not working (a lot of bombs upon bootup)
and I think it's just the TOS ROM that need to be replaced.
I have no time to get the new set of ROM and try so no guarantee
that's the problem.
$250 + shipping

Thanks

>correct....Microsoft is a fledgling company based on stupidity....ha ha ha!

Based on the stupidity (gullability?) of it's *customers* not microsoft
themselves.

Take for example Microsoft Word for windows. A word processor.
It just happens to take up over 25mb of HD space here at work.
If that's not ridiculous nothing is.

PC developers must be in close contact with Intel, because they always
seem to write programs which need the latest most expensive processor to
do anything useful. Take games for instance. They started off saying 286
recommended, then 386 and now it's need at least a 486 or Pentium! The
games aren't even *that* much better either!

I agree with Timothy, developers use the speed of the processor rather
than speed of their code. PC customers are easy to persuade they need
huge amounts of memory/diskspace/processor speed.

The only reason why things are any different on Atari's is that most
Atari owners have little money to spend on their machines, and so
developers have to make the best use of the limited resources available.
This makes much better programs. When you can add the processor speed you
really see the difference. (ie Calamus on a Medusa!).

I feel much better now! :)

They happened to be in the right place at the right time. The PC is not the most 'popular' in the sense that people buy it because they like it. but the biggest seller because of market
domination due to corporate sales originally based on the reputation of IBM and bought by managers who didn't know what they were buying.

Yes, MagiC is a TOS and AES replacement, and it will work with NVDI
(they both come from the same company).

MagiC will speed up disk operations, and window and dialog operations
(essentially!) NVDI will 'just' speed up the graphics side.

There is a Macintosh version of MagiC being written, which will mean
that your Atari programs will run (unaltered) on a Mac.

Found my UUencoder, BTW. Well, actually recovered it from my backups, but it
seems to still work.

My FidoNet BOSS is a InterNet gateway, so that's not a problem, but I'm still
not sure how to go about sending/requesting files. I do it in "E-Mail"?

: >I have a 68020 (and 68881) in my MegaST4. Can someone give me a good MiNT

: Can a 68020 be installed in an Mega ST 4 ?? How ??

With an adaptor-board called PAK/3
(The latest version alows you to use an 68030 with up to 40 Mhz,
32bit ROM on board, 16 K of Cache)

68881/2 are supported

A 32bit Fastram-board will be available soon! (I've been told)

The PAK (Prozessor Austausch Karte) is a project of the german
c't computer magazine that alows you to replace a 68000 in any
computer (Amiga, Mac, Atari) with a 68030.

Linux 68K will run on the PAK soon (no joke)

MiNT will only work without memory-protection (mintnp.prg)

Hi, All!

There is a trouble with SIGNUM-2 print program:
When I try to print on Epson LQ-100 (24pin) with 320*320, program
say me that this mode is available only for NEC-p6/p7.
This program print on Epson in this mode, but each line printed two times.
After printing hex dump I understood that control code for NEc ic 1C
(like IBM printer), but for Epson this code is 1B (ESC).
I think that with disk doctor (or another program) I could
change 1C to 1B but where???

If you know something about it, please send me
your suggestions on diwil@rphd.stu.spb.su
or FIDO: Dima Wild 2:5030/153

Thank you in advance, Dima.

In article <Pine.SUN.3.91.941116153451.17566A-100000@grad>, Timothy Miller
<millert@csee.usf.edu> wrote:

|Sure, writing an OS in C is fine. However, you need to actually think
|about what it is that you're doing, and develop your critical code in
|assembly (ultimately... prototypes done in BASIC would be fine and very
|helpful). Then you use those low-level modules to build more complex
|modules that you write in a higher level language and where the
|processing in C and the function-call time is not critical. If the
|problem is conceived correctly, the code will not turn out to be a huge,
|slow mess.

This is my personal opinion.. I should have said that throughout this
post, but I didn't.. so I say it now. This is how I feel about these issues...
You may not agree, or you may agree. Let's have a friendly discussion.
This could be fun!

The most important thing in operating systems development is that the
OS be designed properly and implemented correctly. Second consideration
is maintainability. Its very important that the operating system be able to
be updated and modified without a tremendous learning curve.

One reason that C is popular for OS development is because it is fairly
easy to understand (redirect C code flames to /dev/null please) and it
compiles to pretty tight code. If you have a decent C compiler (like
Lattice C v5 or Pure C), it will be hard to beat its optimized code with
hand-written assembler. And even if you did, you would spend 3-4
times more work/time developing the same functionality.

I do agree with you that certain parts of the operating system have to
be in assembly language. In my mind critical code is code like BLiT
operations, time critical operations like MIDI timing, the code that
reads a sector off of a disk. Critical code is not the the code that draws
dialog boxes on the screen. You should be able to speed this code up
by looking at the design and performance analysis of the system to
increase the performance of the system.

But.. again, when you are working on a team of engineers that can (and
will) change over time.. the most important thing is that the code be
maintainable. There is nothing worse than a section of code that no
one is willing to touch because they can't figure out how it works. That
code might as well be dead. Usually what will happen is that someone
will come in a completely re-write the code based on its behavior and
then modify that. That's a significant time and cost right there.

|
|Of course, not everything has to be optimal. For example, in my AF, I
|have a routine which closes all windows. I COULD traverse my linked list
|and close them all in that routine. However, I have another routine
|which deletes a specific window and it's used more often. So, my
|close_all routine keeps calling my close_window routine, telling it to
|close the window which is the head of the list, until the head of the
|list is NULL. Either way, neither routine has to be particularly fast
|because window manipulation of that sort isn't done very often, and the
|OS calls themselves take far more processing time than any of my code.
|So, I save space AND development time by (perhaps inefficiently) reusing
|already existing routines.

Cool! The best code to write is the code you don't have to write. Every
minute you are saved from writing something that isn't needed is a minute
you can spend adding more features to your application (or spending more
time ensuring that you deliver a high quality product!).

|
|In fact, things like this happen all throughout my AF. I considered all
|the low level things first, and then then built on them. When I
|discovered that there was something repeated, potentially useful for
|other purposes, or something I'd forgotten, I ripped the code out,
|generalized it, and made it into a seperate function.
|
|>
|> >
|> > Windows, OS/2, System 7, UNIX and others suffer from these problems to

|> > to perform a context switch? Come on!). UNIX is HUGE, but it's fast and
|> > if you're running a very large network, it's not so bad.
|> >
|> When I went from my TT running GEM at 640x480 16 colors to Windows
|> on a cheaper PC clone 486 DX250 at 800x600 256 colors with Norton desktop,
|> the Norton desktop was *much* faster. I like both machines, Atari and PC.
|> I think Windows with just the Program Manager _sucks_. Thats why I use
|> Norton.
|
|Depends on your view of 'fast'. A Mac Quadra can redraw the contents of
|a window MUCH faster than a Falcon, for example, but there are delays in
|the user interface (flashing of the menu selection, zoom effects for
|opening/closing windows, timed software delays for UI effects, etc.) that
|make some of the more important parts (like instant responce) unbearably
|sluggish to work with. This is a psychological problem. When I make a
|selection, I want the system to react instantly. When the system is
|doing actual work, I'm distracted by watching the work being done. The
|Mac may take less time overall, but the delays where the system does
|nothing are quite obvious and irritating.
|

I have to be honest. I have been using a Quadra 800 for almost 2 years now. Sure, there are times that I really hate the Mac OS and I hate some of the delays
that I see. But, overall.. the experience has been fairly positive. I guess each person
has his/her own idea of what is acceptable. I find the Quadra 800 to be acceptable.
However, I know that I couldn't live with some of the smaller machines. No way.

One thing to think about.. there is alot more things the Mac has to worry about than the Atari. For example, the Mac can have multiple monitors on the same machine with different video cards that are displaying at different pixel depths.
The possible cases here alone can be a cause for some of the extra processing time needed for things. This is just one case, there are lots of others.

|Another reason for Windows' sluggishness is that VM is done very poorly
|and is a major bottleneck in the system. If things weren't so damn
|large, we wouldn't need all that memory (most of which is filled by
|Windows itself and NOT applications), and, in at least that area, Windows
|would be a lot faster.

Yes, but the windows system has VM available. The Atari doesn't (on Atari base models, yes I know there are third parties that do it) and some people might consider that important. On the Mac, you can turn off the VM, can you do this on Windows? I honestly don't know, I am not a big Windows user.

|
|I'm QUITE certain that my AF is not nearly as advanced as some of the
|others for the Atari. It's something that I think is ellegantly
|designed, but applicable to only myself because it contains only what I
|want in it. I don't have to make is mega-powerful and flexible because
|I'm not worried about someone else wanting some other feature that I
|don't have, and when I need a new feature, I have the source so I can just
|add it.

My experience is that the most important part of development is design. If you think you got the design right, awesome! You are 90% there. The other 10% is just code ;-)

Hey, as long as it suits your needs it doesn't really matter does it?

|Fun discussion about software engineering philosophy. Keep it coming. :)

I agree. Let's continue. Its been fairly interesting..

3208. Re: Turning off MTOS

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 18:39:50 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3ag81m$p34@golem.wcc.govt.nz>
Source record: 176894

] In the release version of MultiTOS, the multitasking AES is the slow bit -
] MiNT is very good speedwise. It is possible to run MiNT with the normal
] ROM AES - this allows use to multitask TOS programs using Miniwin and
] access MiNT filesystems (e.g. MinixFS, RamFS, NFS/MiNTnet etc.).

The AES doesn't multitask. MiNT does, and simply running MiNT on the
system results in a very noticable speed loss, even if all you've done
is stuck MINT.PRG in the AUTO folder, and that's it. It there was
some decent assembler code thrown in, rather than good old slow C,
it might work better.

] Unfortunately, the one exception to this is that the MiNT released with
] MultiTOS CANNOT be run with the old ROM AES. However, MiNT v0.9x
] (for which binaries are available from most ftp sites) does work, as does
] any version released by the MiNTlist in source form (although only with
] memory protection switched off).

So this is why it (v1.08) works on my STE? (I took the PRG from a
copy of Multi-TOS a friend had, as my system only has 2meg, I didn't
have much hope of compiling it. Not that I'd want to use it, Geneva
produces no slow-down I can notice...

] When MiNT 1.11 is released in binary form (very soon) it will work with
] the ROM AES, apparently even with memory protection switched on.

You mean there's been a check routine put in for a 030? This is a
big thing!?

I'm surprised Atari is touting Multi-TOS as it's great Multi-tasking
system, the Kernal they use is too slow to me of much good. Sure,
on a Falcon or TT it doesn't matter too much, but comparing Geneva
or Magic to it on any machine, and it certainly shows how much better
they could have made it!

] I am considering investing some money ina new desktop for my system
] (Falcon 030), I would appreciate any comments users have on the
] above products, so that I can decide which one is best?

AFAIK, there isn't an English version of Ease, so that may be a problem.

After looking at the demo of Ease, from what I can make out of it,
it looks extremely cluttered with the menus full of options that in many
cases could be represented equally far better. It looked very bland
IMHO. Neodesk 4 takes a bit of getting used to, but if you can put up
with the ridiculous amount of time it takes to load & initialise, I
think it'd be a better program. (I've got to justify it as well, after
buying it. :)

Both have reasonably similar features, but the interface of Neodesk 4
looked to me, a lot nicer. The main features were a lot more obvious
as well. (Yes, I can read enough German to get by, so I understood
most of Ease).

Another advantage of Neodesk 4, is the online help, which would probably
be a pirates dream, as pretty much the entire manual has been included
in a hyper-text type file that can be accessed by hitting the HELP
key in whatever dialog/window you want help with. This does come
in handy if you can't be bothered looking through the manual (which is
very good as far as software manuals go!)

] How can i obtain a Demo version of Minix ?
] I've heard that Minix Demo will be putted
] on micros.hensa.ac.uk ..

A demo-disk has been available for a fair while now, and while it doesn't have some of the more major options, it is relatively complete, and gives a good example of how it all works. I'll say one thing for it, it's fast! I expected it to be standard CLI speed... Text crawling down the screen, but this displays it at a pretty good rate!

I can't find it in my index's, but they're pretty old. I would have gotten it from, atari.archive.umich.edu (./atari/), ftp.cs-tu.berlin.de (./pub/atari/) or ftp.uni-kl.de (./pub/atari/).

Have a look at the index files there. It's could well be on micros.hensa.ac.uk.

3215. Re: MAGIC and NVDI

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 19:08:00 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3ag9mg$p34@golem.wcc.govt.nz>
Source record: 176760

] I understood that NVDI is primarily a GRAPHIC accelerator, what Magic will
] up ?

Magic speeds up TOS functions basically, by replacing most of them,
it gives better/faster disk accessing and various other features.

(Has anyone got a list of what Magic does!? I would like to know
everything that goes on, as I know it has more than just an improved
filesystem).

NVDI accelerates graphics, correct. It also implements a good form
of GDOS (version 3 will apparently be able to work with the Speed-GDOS
fonts). You would not believe the difference in speed. Well over
twice the speed of standard GEM screen-redraws, windows, Line-A
functions etc. It also has a relatively good mouse-accelerator.

If you haven't got it already, get NVDI, you'll wonder how you managed
to put up with things without it! :) (Shows what a few pieces of
assembler code can do to a program, which is more or less what NVDI
does, patch certain TOS/GEM routines (which are in C), with far faster
assembler routines. A 68030 optimised version of NVDI on a falcon
or TT would be very impressive!

If I do fit one, will it then be possible to play the generation of games such as obsession and Zero-5?

> Can anybody help?

I believe it is the case than nothing really needs the blitter, and it is
not worth spending any money to have one installed (if it is even possible).
Buying NVDI would be a much better choice.

The blitter is not really part of the set of hardware enhancements that
the STE/Falcon enjoy. In other words, I don't think it will increase
compatability with anything.

Wow, somebody finally understands what HW and OSes are there for: to run SW. You find the best SW to solve your problem, then you buy the HW and OS which runs the SW best...simple. Sometimes the answer is a PC, sometimes a Mac, sometimes (strange as it may seem) an Atari, heard a rumor that someone once even found justification for an Amiga...

Remember the old "power without the price" campaign? Saw a special at one of the local computer superstores last night: a cheapo performa (16mhz 030, 4mb, 160 HD) with color monitor, keyboard, mouse, Clarisworks, and an HP color inkjet for $999. Old technology, but a cute little basic system, at a decent price. Why couldn't Atari have done things like that?

>correct....Microsoft is a fledgling company based on stupidity....ha ha ha!

Well... I think there is something a little bit stupid about buying without investigating all the possible choices. For example, shortly after Windows came out there was another product that was hailed as "Everything Windows Should Have Been" by Byte (I think). I can't remember the product name though. Anyway, it was far smaller, far faster, far nicer to use, and, had all of the same features plus some. Problem was, the company had no money for advertising (sound familiar?) and thus the product did not sell well. If the 'system' for shopping was a bit different; if more people checked out all options instead of just shelling out $$$ for whatever has the most name recoginition, then maybe a lot better products would be the 'standards' today.

Maybe it is a bit like the
American car thing. I was one of the people who refused to believe that American cards had become crap, and that the Japaneese had far superior quality. Of course, as it turns out, around 1972 American cars did begin a fast downward spiral that they are (I hope) just now pulling out of. Despite all information to the contrary, most americans still persisted in believing that American cars were 'best', and it took many years to turn that around. When the mass populace began to turn to Japanese cars more and more, it finally forced the Big 3 to begin making *better cars again*! That same principle would work for software and hardware if consumers were (collectively) sharp enough.

Of course, now everyone has realized that, in fact, the best cars are old VW Bugs, circa 1968 for example ;-)))))

Anyway, if people started buying smaller faster operating systems, and smaller faster applications, even if the product did not have big name recognition, then pretty soon Microsoft and Apple and such would have to make their products smaller and faster to compete. The power of the (collective) informed consumer is something the Big 3 learned the hard way! I doubt Microsoft or Apple would be as stupid.

Great news! One thing concerns me though. The readme.src file states
that "gcc 2.5.x causes problems..."

Now I'm aware of problems with 68000 code generation up to 2.5.7, but
2.5.8 is _supposed_ to be ok in this respect. Indeed, I compiled
MiNT1.11h2 (no MultiTOS) using 2.5.8 and have found it to be very
stable. So what's the deal?

Cheers,
Steve "wishing he'd subscribed to the MiNT-list sooner" Woodford

Didn't see the original so I am following up to the follow up...

It is possible to have your STE *AND* SLM act as a printer for the PC,
but there are some difficulties with it.

Using the Diablo emulator that came with the SLM804 you can tell it to
redirect the serial port input of the STE to the emulator and then
connect that serial port to the PC with a null modem cable. On the PC
you can configure the print output to go to the serial port and select
the Diablo 630 printer driver. But wait, there is no Diablo 630 driver
for the PC so there's the first difficulty.

But there are Epson drivers and there is the LaserBrain emulator, but
there is no option to route the serial port to the emulator.

What I did is write a little program that would read the bytes off the
serial port and print them out and then install LaserBrain before
running the program. On the PC I installed the appropriate Epson
driver and sent the output to the serial port. So when I printed
something on the PC it came out the SLM804.

Only problem here is that it looked like a 9-pin epson printout.

So it is possible, but at this point not too practical (unless it is
the only printer you have).

Now for a question of my own... Is it possible to drive LaserBrain
at a higher resolution and match that up with a higher resolution
driver on the PC? If not, how hard would it be to write an emulator
on the ST that would emulate a higher rez printer that has a driver
on the PC? Any industrious programmers think they can do it? I plan
on taking a closer look at it when I have the time, but it will
be all new territory for me (programming printer drivers that is).

If anyone is interested in doing this or could provide me some pointers
or references on how to do it, please let me know.

e-mail to r.hoekstra1@genie.geis.com

I use 8-bit mono sound on an 8-bit Sound Blaster, and I am
completely satisfied. I don't know what kind of hearing these editors of
PC Magazine have, but it must be bionic. Anything less than TRUE STEREO
sampled at 44.1Khz and 16-bits.....they say sounds like a BUZZ-SAW.
Personally, I have better things to occupy valuabe hard disk space than a
bunch of huge sound files. Anyway, most people route their PC sound
through a pair of $20 speakers that couldn't sound any better no matter
how clear the source!

Define reasonable. If (as you state) you _need_ a Pentium to get reasonable floating point performance, then you believe that anything LESS than a Pentium does not produce reasonable floating point performance. Since Pentiums run DOS/Windows and are screwed, then I wonder what you run. You must take it upon yourself, then, to believe YOU run a system that gets reasonable floating point performance (Pentium-class performance) that does NOT run DOS/Windows. I'd like to know what you are running, then? Won't you share that with us??

Gee, man! You sure are insistant that the 486 produces "pathetic
floating-point speed." Then you state that "the rst of the hardware is
totally crippled for DOS compatibility. What are you talking about?
What hardware is crippled? A Pentium or 486 "totally crippled" for DOS?
You been smokin' something you want to share?

What floating-point intensive applications do you run? What
floating-point intensive applications have you observed to be "pathetic"
on a 486? How many users methodically run floating-point applications,
anyway? You must be witness to it - so tell us WHICH ONES? As far as
DOS machines go....It seems (in my humble experience) that much of the
software does NOT access the math co-processor capabilities anyway. With
all the DOS machines I've had prior to the 486 (which has math
co-processor internal, of course) I NEVER had a math co-proc and never
missed it.

I take it you propose a Motorola 6888x solution? No, I'll bet
you've looked at PowerPC benchmarks in some magazine and were dazzled by
sparkling floating point results. The PowerPC does offer floating-point
muscle, but really..... Must you condemn the rest of the industry on
that basis alone?

> at 320x200x256 despite the card being able to pull off 1024x768x16-bit?

Every VGA card I've bought came with loads of drivers for those
operating systems you've mentioned. The manufacturer of said card has
always had a BBS that I could call to obtain the latest drivers. On the
contrary, I can display 80 x 50 on most dos programs, even 132 x 50 on
some. Why bother? Who cares?

It's my PLEASURE to choose amongst those operating systems,
anyway. Just because whatever platform YOU run doesn't allow you the
luxury of such choice, don't condemn such luxuries on other platforms by
attempting to raise confusion by introducing hypothetical problem
situations. Those operating systems DO exist, and they ARE being run in
many configurations across a myriad of VGA card configurations. So
sometimes I must locate a driver. It allows me the choice of running the
VGA card of my own picking. That, my friend, is another LUXURY that you
likely do not have.

As for games running 320x200x256 - I find this sufficient. What
resolution do video games such as the Jaguar or SNES or Genesis display
on a television set? Apparently it's sufficient for most
gamers...including this one. Question: What resolution/palette do YOUR
games run on?

>
>
> The mere fact that you have to know anything about "conventional"

> Memory is memory, on any system that isn't running DOS.

The confusion surrounding conventional/high/extended/expanded
memory **IS** a bummer on the PC. However, anyone who is keen on
understanding computer architecture and upward/backward compatibility
should have no trouble comprhending such memory, and the HOWS and WHYS of
how it came to be this way. Obviously, you don't appear to be such a
person, so forget it.

You must be an ST user, since you stated you have an 8Mhz 68000.
I suppose the Atari TT with its "ST RAM" and "TT RAM" flies in your face

after you state that "Memory is memory on any system that isn't running
DOS." Gee - does the TT run DOS?????

HAH!!! VME port indeed. How about a list of video cards and
manufacturers who peddle VME cards. I'd like to supply you with a list
of PC video cards and manufacturers, but I haven't the time and the net
hasn't the bandwidth. An easier solution would be to look in the Product
Index of ANY issue of Computer Shopper and sit down with a six-pack.
IRQs take some getting used to, but anyone who can't figure them out and
resorts to calling them "stupid" must be a vacuous imbecile himself. I'd
have much less difficulty setting an IRQ and installing a SCSI ISA card
than obtaining an Atari DMA-->SCSI host adapter.

>
> PCs are crippled by the stupid, ancient architecture. PCI fixes this,
> but there are too many PCI cards coming out with 8088 BIOSs on them
> instead of supporting OpenBoot.

PCs have evolved from an old architecture - who doesn't know
that? The inherent drawbacks and limitations of modern PCs are simply
the price that has been paid for 15 years of upward compatibility. This
"price" has, however, been more than compensated by the world's largest
software arena. Anyone who cannot comprehend that fact and resorts to
words such as "stupid" to describe the PC has no business evaluating PC
architecture.

> PCs weren't even state-of-the-art when they came out. There were
> UNIX workstations back then, you know.

I'm sure most reasonable people will concede that PCs had their
own merits at the time of introduction, which is why they commanded such
a high price back then. I'm sure a "dumb" terminal would have been a
more cost-effective solution if the objective was merely to connect to a
Unix system.

>

It might be usable, but only on very small and simple PostScript files;
you should (for example) be able to print or display a page full of
lines or something, but once you get into fonts and bezi\'er curves
you're into serious memory requirements...

25Mb is a lot for a word processor - and I am unable to verify
that because I don't have Word. However, what little I've used Word was
importing pictures, faxes, and many fonts onto the same document - all in
color, and in the space of a few seconds and mouse clicks. Is there some
mighty and powerful Atari program which does the same?

Intel has lots of competitors now. Games are becoming
increasingly complex. DOOM is the first game that I find is less than
acceptable on a PC less than a 486DX2/66. I suppose the fact that a
64-bit Jaguar is the necessary TV video game that is DOOM-capable speaks
for the fact that the new games *ARE* processor-intensive by nature,
rather than a secret Intel alliance. DOOM, I would say, is *THAT* much
better than other games.

I suppose lazy programming might be to blame for some of the HUGE
hard disk requirements, but with wholesale quantities of processor power
AND harddrive space for little money, its not so crippling on the PC.
Since most of the Falcons I see being mentioned on some people's
signature files (here on the net) boast of 4MB RAM and 65MB hard drives,
such occurances in the Atari world would indeed be ridiuculous. My
latest 486DX2/66 cost only $1200 and included 8MB RAM and 420MB drive -
so I'm fairly positioned to contend with large programs for little
money. I'm surprised at some of the system requirements, but I'm happy

that the vast array of software is available, and content that my $1200 system will run it to my satisfaction.

I'm sure illiterate people have no use for the encyclopedias.
Doing an 8-page paper from the comfort of your bedroom and enlist the aid
of 3-4 sources without going to the library sounds appealing to me.
However, my point was not to debate the merits of Multimedia
encyclopedias, but to illustrate the vast array of PC software. Excuse
me while I interrupt this session to blast some bastards in a game of
PC DOOM. Have fun with whatever you can play that comes closest.

<much previous talk flaming huge OSs and programs on other platforms
not included to preserve sanity :-) >

Some argue that inefficient OSs are marketed because of the
availability if faster hardware. I argue that human nature desires
the faster hardware and with it they demand more sophisticated OSs and
programs. Thus development views optimization as low priority and
adding features is high. Debugging hooks are added which makes the
code bigger and often slower. Downward compatibility is also a big
issue.

It took Atari 4 years (from 1985 to 1989) to release TOS 1.4, which
was basically a bug fix of TOS 1.0 (1.2) that would fit in 192k ROMs.
And despite this length of time, there were still bugs (although not
as severe) and a smal but significant number of programs were
incompatible. Although there are many other reasons for why it took
so long, one might have been the 192k restriction. Optimization is
also much more important on a platform like the Atari since the TT
(Atari's only machine that offers a significant amount of raw compute
power over the original ST) is a tiny share of the Atari market.

IBM has persisted in optimizing OS/2. It's current version requires
less resources than the previous 32 bit versions. To have
Presentation manager, DOS, and Windows support still requires large
resources. But as I pointed out to someone who complained about the
lack of a 32 bit DOS, OS/2 in it's minimal configuration requires
about 2 megs of hard disk space and offers a pre-emptive multitasking
command line environment.

Steve Wells <wells_s@kosmos.wcc.govt.nz> wrote:
>The AES doesn't multitask. MiNT does, and simply running MiNT on the
>system results in a very noticable speed loss, even if all you've done
>is stuck MINT.PRG in the AUTO folder, and that's it.

This simply isn't true. Here are some benchmark results (all tests run
on my TT with a hi-res monitor and TOS 3.06):

NESS BENCHMARKS (NBM12.PRG)

plain TOS MiNT 1.12 (MINTNP.PRG)
Math 511% 503%
Memory 465% 459%
Dialog 396% 393%
Graphics 64% 67%

Quick Index (QINDEX22.PRG)

CPU memory 115% 113%
CPU registers 100% 98%
CPU divides 100% 99%
CPU shifts 100% 100%
GEM dialog 99% 98%
TOS text 105% 77% (*)
TOS string 99% 173% (**)

The only "noticeable" difference (normal humans generally can't notice
a 1 or 2% difference in performance) are the TOS text and string output
functions. MiNT is much slower than plain TOS when performing output
one character at a time, and much faster when outputting longer strings.

> It there was
>some decent assembler code thrown in, rather than good old slow C,
>it might work better.

There's some very decent assembler code thrown in; it was generated by
a compiler rather than a human, but decent modern compilers (like GNU C)
are getting very good at what they do. You might want to try one someday.
You might also want to consider the fact that algorithm and data structure
design ultimately have much more impact on performance than the language
of implementation.

>So this is why it (v1.08) works on my STE? (I took the PRG from a
>copy of Multi-TOS a friend had, as my system only has 2meg, I didn't
>have much hope of compiling it.

Somehow I'm not surprised that your pirated software doesn't work well;
the MiNT that came with MultiTOS was designed to be used with MultiTOS,
not on its own.

3236. MiNT 1.12 sources and binaries now available

Newsgroup: comp.sys.atari.st
Date: 1994-11-17 21:40:43 UTC
From: ersmith@netcom.com
Message-ID: <ersmithCzFLJv.M4v@netcom.com>
Source record: 176554
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Version 1.12 of the MiNT multitasking program is now available in both source and binary forms. This release is primarily intended for programmers who are already familiar with MiNT, or for MultiTOS users who wish to upgrade their existing MultiTOS installation. The license under which MiNT 1.12 is being distributed encourages redistribution, and I hope that some more "user-friendly" packages (such as the MiNTos Unix work-alike) will soon be available. MiNT 1.12 may also be distributed with commercial products, provided that the licensing terms in the "copying" file accompanying MiNT are adhered to.

The files (available from atari.archive.umich.edu, micros.hensa.ac.uk, ftp.uni-muenster.de, and other Atari archive sites) are:

mint112b.zoo MiNT binaries
mint112s.zoo MiNT source code
mint112d.zoo MiNT programmer's documentation

>as there's not a great deal of benefit.

You're close. MiNT is a multitasking kernel, and it is not slow (in fact, it's faster than plain old singletasking TOS for most things). MultiTOS itself is a replacement AES that MiNT loads. The released MultiTOS AES is really, really slow, and keeps MiNT from running fast by polling (ie, running in a small loop, checking for input every now and then, instead of sleeping, and waking up when there's input waiting).

You can AFAIK run the MultiTOS AES without MiNT, which gives you some new features (well, the released version isn't really much different from 2.06), but that sotra defeats the purpose of buying it, right?

There's at least one new, unreleased MultiTOS AES that provides a lot of new features (like SpeedoGDOS fonts in dialog boxes and a few other cool things), and a big speedup, but it'll never see the light of day (legally).

MiNT's also overgone a lot of changes in the past year or so that make it a lot faster (I think it's stil lacking an internal file-cookie cache, though).

Source record: 176799

Hi all! Quickie: I'm looking for the game "Major Motion" (is that even the name?) which was originally released for the ST way back when I had to load TOS from disk. I remember it being a really good version of Spy Hunter.

Is this game still available? I've been a little out of touch with the Atari world for a while, but I've dusted off the ol' ST and I can't find that game. Luckly, my SunDog is working...:^)

If anyone has Major Motion and is willing to sell it, please contact me. I'm sure we can work something out.

Thanks!

True, virutal desktops are pretty painful on a plain ST. It's nice to
have a whole page on-screen with PageStream, though (and it's a lot
faster than PageStream's pathetic scrolling and screen re-draws).

I think Monster knocks about 10% of your CPU-speed off, according to
GEM-bench, though the screen paints seem a lot slower.

That's funny, there are still two of them sitting in my home office working quite nicely, thank you. Sure there is little hope of any new machines coming out of Atari, but that doesn't keep me from getting very good use out of the machines I have now. Sure there isn't nearly as much software available as for my 486 sitting next to my Falcon, but there is more than enough for the things that I like doing with my Falcon. Point is, many of us prefer using our Atari machines and don't really have a *need* to use anything else, so why can't you just let us be happy with what we have instead of always rubbing our noses in the situation???

Sorry, Roger, but I have absolutely no respect for you or your opinions after seeing the way you post on this group.

I can understand the upgrade from an ST to a 486DX2/66, but I have a Falcon
and such a 486 at home and for most of the things I do with the two of
them I don't really see the 486 being that much faster than the Falcon.
Of course, the 486 mostly gets used for games and kids programs, but with
Windows the 486 just doesn't impress me much compared to my Falcon.

> What *USE* is a multimedia encyclopedia????

Um, I don't want to discuss the use (and sense) of encyclopedias, but it
is a matter of fact that you can e.g. use (!) CD-ROMs with sequence data
(human genome project and the like) on a PC while you can't on an Atari
a) because it is too slow, and
b) because the software won't run on Ataris at all.

That's one of the reasons why I bought a PC (running Linux). Of course
your mileage may vary.

From: peseb@freeport.uwasa.fi
Message-ID: <3ago86$qpk@zippo.uwasa.fi>
Source record: 176709

Hi all,
I heard a rumor some time ago about a version of POV
coming out by some private code wiz that was to be
optimized for the Atari Range..
Here's a few questions:
1) Is it out?
2) Is it even coming? :)
3) Will it also be Falcon optimized, ie. use DSP?
4) Release date?

-Peter.

Ps. The DSP *can* help *alot* in calculations like Raytraycing...
The trick is just how to get it and the CPU to work
simultaneusly...(I guess the CPU would have to do the
float-to-int conversions?)....

You don't need MiNT to Fopen() the U:\DEV\MODEM1 (or MODEM2, SERIAL1,
SERIAL2) device, it is provided by HSMODA. After opening you can use
Fcntl() to set the linespeed, flow control etc. if necessary. Then you
simply use Fread()/Fwrite() to transfer data. You really should read
the HSMODA documentation.

Yep, that's part of the error correction protocol between modems, e.g. V.42 or V.41. But even without the use of such protocol, there shouldn't be any loss of data, a computer can usually take data from the local modem much faster than the remote modem can supply them.

> When the modem is in fact waiting on the OK to send, and the port
> driver software insists that it is OK to send, transmissions become
> garbled.

It is unlikely that the local modem has to wait for the remote modem, but off course the computer will deliver data to the local modem much faster than the local modem can send them to the remote modem. That's what CTS flow-control between computer and modem is supposed to handle.

> Quite simply put, even when it is clear (from the idiot lights on the
> modem, and the munged screen on the remote terminal) that the BBS modem
> is not ready to send, HSModa4 says it _is_ ready (Function cauxos%
> returns a -1, meaning Clear To Send).

It's not a bug, it's a feature of HSMODA. :-) Since Atari documented that you should use the BIOS functions instead of Cauxos(), Cauxis(), Cauxout() and Cauxin(), HSMODA assumes that absolutely nobody will use those Gemdos functions. You seem to to be that `absolutely nobody' :-))

But seriously, I think you're right. HSMODA should at least block the Cauxout() following the Cauxos() untill the character has been delivered safely.

> I do not claim to know enough to write my own serial routines (if I did,
> I'd go ahead and do it), but I do know that TurboCTS works with all my
> "other" software, while Semper will NOT work with it. I'd call that a
> problem.

Hmm, IMO the major problem would be that Semper uses the slow Gemdos functions to access the serial ports. In the long turn you might be better of rewriting it to use Fread()/Fwrite() & co.

More than that, MagiC replaces _all_ of TOS (bios, xbios, gemdos, vdi,
aes) and off course it ofers pre-emptive or co-operative multi-tasking.

No, you're not! It wouldn't be possible to run GEM-Bench if you hadn't started some sort of AES on top of MiNT. Obviously you're talking about MiNT+AES.

It's one thing to discuss how the Intel/Microsoft/ISA
architecture was formulated eons ago. It's quite another thing to
discuss which system gives you the most BANG for the BUCK in this day and
age. Today, $1200 buys you a COMPLETE PC system with 486DX2/66Mhz
processor, 8MB RAM, 256K cache, 420MB hard drive, 15" non-interlaced
1024x768 monitor with 32-bit local bus card to drive it, high-density
floppy drive, mouse, keyboard, operating system, and all necessary
accoutrements. That's $1200...today! (perhaps even less in the near future)

Along with that, the WORLD'S largest software base, bar none!

A powerful computer (by today's standards) with all the software
available that one could dream of. The best BANG FOR THE BUCK one could
ask for. Is that not what personal computing is about? Who cares WHY
the PC architecture got where it is. The definition of "popular" can be
twisted to mean anything....but it won't dispute the fact that the PC
IS the most popular microcomputer architecture. Have any questions
about that? Walk into a COSTCO warehouse and look at the software table.

Don't worry.... I'm doing the math on a 486DX2/66 system now because motherboards are selling for $268 in Computer Shopper.

I'll upgrade to Pentiums when THOSE motherboards are in the sub-$300 range - and I'm quite sure the problem will be corrected by then...although the way PC prices have been falling, it shouldn't be too long now!!!

Well any one from ST-Review reading this, well the price has just jumped up over here and for what is in this mag I will be droping it at the end of this year, as its far to dear here for what it contains, may be its ok if your are into Midi or Grpahics/DTP, but very few Falcons and TT have been sold here, their is far to much emphasis on Graphics in this mag..

My current opinion of the magazine its more for Falcon/TT users and with this massive price hike its no longer in my lead...

What we need in a good mag is along the lines of ST-World, that was a mag...

The placing of 2 disks on the cover is a great wast of money, I just end up using most as a blank disk, but that makes blank disks very dear....

Can some one explain the Overseas price quoted on the cover of 4.5UKP, as its being sold hear at $19.75, far over the exchange rate of 2.5 times the UK pound....

So ST Review, drop the price, remove those stupid cover disks, (ST-World never had them) and have reviews articles for the average Atari user...

My Subs (local) stop in December....

Hi,

I have an ATARI 520ST, 1meg, double sided (internal)drive, and a
standard ATARI monochrome monitor, it was bought new around the middle
of 1989 (that's all I can remember right now).

Yesterday, I was busy splitting archived files when I was called away
from the machine... approximately fifteen minutes later I returned -
the power lights for the monitor and the computer were on, but the
monitor screen was blank (black), as if it was turned off. Switching
the ST off and on made no difference to the screen - also, when the ST
is turned on it won't check the internal drive for a disk - all I get
is the little green power light!

Thanks,

Gary

The exchange rate for the UKP is 2.5 here (roughly, and it's
Canada), and I get my magazines for the same price I always have -
$9.95 + tax, which raises it to $10.65 (canadian). You're being
gouged in New Zealand, man. (You are in New Zealand, aren't you?)

:] I understood that NVDI is primarily a GRAPHIC accelerator, what Magic will
:] up ?

: Magic speeds up TOS functions basically, by replacing most of them,
: it gives better/faster disk accessing and various other features.

: (Has anyone got a list of what Magic does!? I would like to know
: everything that goes on, as I know it has more than just an improved
: filesystem).

Yes, a full technical list of the features will be GREAT !!
I read some review on mags and, even some of them were good, nothing can
compare to opinion from the internet community.

: NVDI accelerates graphics, correct. It also implements a good form
: of GDOS (version 3 will apparently be able to work with the Speed-GDOS
: fonts). You would not believe the difference in speed. Well over
: twice the speed of standard GEM screen-redraws, windows, Line-A
: functions etc. It also has a relatively good mouse-accelerator.

: If you haven't got it already, get NVDI, you'll wonder how you managed
: to put up with things without it! :) (Shows what a few pieces of
: assembler code can do to a program, which is more or less what NVDI
: does, patch certain TOS/GEM routines (which are in C), with far faster
: assembler routines. A 68030 optimised version of NVDI on a falcon
: or TT would be very impressive!

What about compatibility ? I read in an ad tha Magic is " not yet Cubase
compatible", when it wil be ? Any news ?

OK I have to agree with you there. :)
BUT, do these new games actually *need* the processor speed and memory to
do what they do, or would it be *possible* to do it with much less? (with
admittedly more time needed to optimize the code)

>> The only reason why things are any different on Atari's is that most

You can use exactly the same memory and hard drives on atari's (maybe
with an adaptor, depends which machine). However, they are still not
cheap. Maybe cheap compared to what they were a few years ago but still
not cheap!

>Since most of the Falcons I see being mentioned on some people's

>such occurances in the Atari world would indeed be ridiuculous. My
>latest 486DX2/66 cost only $1200 and included 8MB RAM and 420MB drive -

Me and my house mate bought a 486DX2/66 VLB with 4mb RAM and 240mb
drive. This was a week ago and it cost 810 pounds. I'm not sure how that
compares but it was the cheapest we could find in the adverts.

My Falcon which I bought about 18months ago cost around 900 (I can't remember exactly how much) for 4mb RAM and 65mb drive (Pagestream DTP was included in this price).

The PC could do with another 4mb of RAM and a soundcard. (also missing SCSI)
The Falcon (now with blowup+NVDI) is pretty good as it is. For me anyway.

My point is that the minimum requirements for PC's and Atari are much different, but the programs themselves have a similar amount of features/capabilities.

>so I'm fairly positioned to contend with large programs for little
>money. I'm surprised at some of the system requirements, but I'm happy

>system will run it to my satisfaction.

My 486 is pretty good too. I just need some decent software for it now. I have been busy trying out the PD games so far!
Trouble is software is very expensive too now. (For both machines)

Forget it - there is no software on the ST which supports QIC-80
(floppy) streamers.

SL>IDE-drives are very cheap compared to SCSI
SL>Is it possible to connect a IDE Streamer to the Falcon ?

Where would you get an IDE streamer?

All those cheap PC streamers are connected to the floppy controller.

Hi
I would like information on how to regiser the Photo CD software
COLORDISK PDC The author is Michael Bernards but the software
ver 0.99d has no email or snail mail address.
I believe that atari germany distributed the program.

Trupaint will not handle the TT high resolutions.
GEMVIEW 2.25 wo'nt handle the .pcd format.
I am upgrading IMGCOPY to Ver 3 PCD but haven't received
it yet.

Any other sugestions for Photo CD access software?

dennis

Dear All

I'm interested in buying a CD ROM drive for my Atari ST, and I was just wondering if you need to buy a special ST compatible CD drive or will a normal PC Drive work. Can anyone tell me ? Another question is how much roughly in pounds sterling is one going to cost me ?

PLease reply to dl533@city.ac.uk

:

There is an excellent editor called EditPro that will allow you to edit
files larger than RAM. It will also let you edit disk sectors and memory.

Toad sells it for about $30.00 I think.

(1) No SCSI-aware utility uses the geometry information, otherwise it
would fail on disks with zone recording.
(2) SCSI-Tool (commercial product) supports the defect mapping done by the
SCSI controller.
(3) Both HDX (Atari) and SCSI-Tool support defect detection before
partitioning (the defects are recorded in a defect map outside the
normal partitions).

>this is correct. Binaries exists for it too.
Of course I know this, check the dates. If you read the CHANGES file you
will see that 1.12 contains my patches for Lattice.

There may be new patches required, as people put stuff into 1.11 _after_ I
did the port, so I'll try to sort that out this weekend.

Even with the binary out there, it is useful to be able to build your own
copy in order to incorporate updates etc.

Heinrik --

OK, OK... Just as YOU have said before, _I_ was the one joking this time.

I DO wholeheartedly agree that this area (comp.sys.atari.st) should be kept to discussions about Atari and questions/answers about helping each other get the most out of these marvelous machines. I was, however, amused at how much flack John Townsend got for speaking the truth (like it or not). He did not flame Atari users, after all. Perhaps we should try not to be so defensive.

While it may be true that we are rapidly approaching the uneviable status(?) of owning orphaned computers, I must ask, so what??? Does that make them any less useful? Of course not. Be happy with what you have and keep on enjoying it. No problem. If others prefer PC's or Mac's or SGI's or Fujitsu 1000XLD's or whatever, who cares? Life is too short to fret over it, gang.

All --

I _would_ like to suggest, however, that the recent discussions on the merits of PC's (Pentiums et al) vs Ataris (680x0 et al) be removed to the .advocacy groups as that is _certainly_ where they belong. All this nonsense revolving around childish arguments like 'my computer is better than your computer' is the _real_ waste of bandwidth here, even worse than those tremendously long .signatures some of you seem to be so partial to. :)

The PC-oriented newsgroups wouldn't appreciate a bunch of pro-Atari messages so please be considerate of our desires, too. You know who you are so please cease and desist the deluge of pro-PC posts here, OK?

Thanks,

-Hutch- @ Fair Dinkum Tech

Minix Demo for the ST is now at HENSA, for downloading....

A short description, and what is in the directory....

You can find these files in

micros/atari/tos/p/p045/

The demo version for Minix, a Unix type operating system.
To prepare a Minix boot disk, copy demo_dsk.st, bit for bit onto a 360K
floppy. This can be done by the program file2dsk.ttp. More instructions
are given in the documents.

What is included in this package...

Announcement Minix Information Sheet
demo_dsk.st The disk image for the Minix Demo
file2dsk.c Source code to make a Minix Boot disk
file2dsk.doc Documentation for File2Dsk
file2dsk.ttp Program to make a Minix boot disk from the disk image
file
READ_ME General information about the Atari Minix
Demo, and
details of ordering the full version
manual.ps Manual for Minix in
Postscript format
manual.txt Manual for Minix Demo in ASCII format.

>>difference, allowing 800x608x256 and 640x480x16bit.

>Can this be used in place of Screen Blaster or something like that ?
>Or can you use just the software versions of these ?

Actually all it does is increases the bus speed and therefore the dot clock.
It is supplied with modified BlowUP software which lets you use this to get
higher resolutions.

>All I want is to get 640x480 in True Colour mode on my VGA monitor.
>I'm happy with the other resolutions.

That should be possible.

>How much is this card in the UK ?

I don't know if you can get it in the UK, it cost the equivalent of about 100
quid IIRC.

>what setup I should have, what files needed
>and so on...

Lattice C is quite fast and has an IDE, although not a very good one. It's expensive though.

PureC has no English docs AFAIK, but is supposed to be the best available with an excellent debugger.

gcc is free, well supported and has a good optimiser. But it's quite slow and needs a lot of memory to compile.

HSC is free and a lot of people use that to learn, but it's K&R C instead of ISO.

>I'm used to emacs, is there any similar that will work under MINT? And where
> to find it?

There is, it's called emacs :)

I got it from aaue (or the src.doc.ic.ac.uk mirror to be precise).

MacMagiC is supposed to come out at the end of the year (and will probably,
as usual, be delayed :-). I assume that it will run on 680x0 Macs first,
maybe a Power Mac version will come later.

If you have the field definition, you can easily write a bit code to convert dbase to ascii delimited, the dbase format is just plain ascii (beside the file head), each field filled out with spaces....

Some years ago I did the revers thing, I made a dbf file from a ascii delimited textfile.. about 10 min work...

I also have acces to a C lib (source) for dbase files (named CodeBase)

James Wood <jamesw@CSOS.ORST.EDU> writes:

> ... my point was not to debate the merits of Multimedia
> encyclopedias, but to illustrate the vast array of PC software. Excuse
> me while I interrupt this session to blast some bastards in a game of
> PC DOOM. Have fun with whatever you can play that comes closest.

PC's are beginning to secure my attention. Although I shy from the buzz words and the media attention, the emerging signs of the advent of the "information age" have also caused me to consider that the pundits may actually be right, and that we may be on the verge of something very important. In this light, I offer the following somewhat opinionated and wandering reply to the passage quoted above, partly to challenge the strength of the PC position in the computing world, and partly to provide food for thought. If you haven't yet chosen to proceed to the next article, I hope you find this interesting (70 lines follow).

I have been amazed and impressed at the sophistication and complexity of many PC games, and I certainly acknowledge the popularity of DOOM. However, the most entertaining games I have ever played have been on a Commodore 64, and the (1979 vintage) TI 99/4A comes a close second. I have friends who insist that the most enjoyable flight simulator they have used was the one on the 16K Timex Sinclair. You may question the honesty of these claims, but surely you agree that mileage will vary. Perhaps only a few need the very new, very expensive machines to be richly entertained.

We are currently faced with the problem of choosing replacement equipment for one of our first year undergrad labs, which is open 24 hours a day (it currently has a network of aging NeXTs). Budgetary constraints, combined with the fact that we don't want to subject first year students to X in a lab full of cheap X terminals, have forced us to consider a PC lab. In pursuing this possibility, we have solicited experience from other departments who use a PC lab for first year computer science courses. It would seem that supporting such a lab would require full time (i.e. 24 hour) staffing just to keep the machines running, since PC's crash so often. This gave me the perspective I have been looking for on a problem I have traditionally had difficulty articulating; namely, the quality and amount of PC software is made vastly less valuable by the state of the foundation on which it sits. Windows 3.0 sold ~9,000,000 copies, even though it is a program that comes with the unwritten guarantee that it will lock up your system and trash recent results on a regular basis. When 3.1 removed the first part of that guarantee, the PC world was delighted, seemingly ignoring the fact that the second part still remained.

PC's may be good for games, but then so are machines that sold new for $100 in the early 80's. They also offer productivity applications whose only virtue is that they are well known. Lotus 123 is not more fully featured than Questor on a NeXT, but it is much less stable. People will buy the former because of its name, while scoffing at the latter. It most often seems that a serious evaluation of the relative merits of competing alternatives is entirely irrelevant. I suppose you can enrich your life through CD-ROM, and play "totally awesome" games on a PC, but what attraction is this for the uncountable businesses who buy PC's, or for individuals who buy them for "business reasons"? Where does one find certainty in the claim that locking oneself in a room with a few multimedia CD-ROM titles is a more enriching, or even more productive experience than spending an afternoon in a good library? Will the information age provide valuable returns as immediately as we expect? Will PC's be the vehicles of this return? I personally think that the long term benefits of having the embodiment of human knowledge on a small collection of disks, or at the other "end" of a network are still largely unpredictable. I certainly think that PC's simply aren't up to the challenges of building a stable and permanent information infrastructure (by PC's I mean machines with Intel processors running Microsoft software -- running NeXTStep on an Intel machine, for example, changes the scenario completely). PC people may continue to use their PC's to run client software for access to information resources served from different platforms (partly because they are stubborn, but mainly because companies like Microsoft achieved a critical mass of misinformation ages ago), but is it logical to make strong claims for the merits of a platform that can't meet the challenges of providing that infrastructure?

I have access to a large collection of machines at this unversity (Sun/sparc, SGI, Mips, NeXT, Power PC, transputers, PC's, et al.) and I put them to use, but I also continue to use my 1985 vintage 8 MHz 68000 based Atari 1040ST productively. I would venture that I use it as productively as many people who have spent far more time keeping up with the latest upgrades (both HW and SW, and earning the money to do so), than in learning how to effectively use what they already have. I am certainly hamstrung by such things as compile speeds, but perhaps the most sensible position lies in the middle.

Cheers,
Scott

] Sorry, I don't understand: "managing the Falcon"?
]
] Of course, Atari is still building Falcons and TTs.

The news was that Atari had ceased (temporarily?) production of TT's and Compo had taken over marketing of the Falcon, due to Atari not being able to bother as they wanted to pitch everything they've got into working on the Jaguar, (which still hasn't helped as they've produced about half as much as was supposed to be available). Good machine, but typical Atari messing around.

Fiver for one table plus the cost a disk from a PD library = 6.50.
If you want four tables 6.50 * 4 = 28.00 Obsession only costs 24.95. So
which is better value for Money?

Yes I am biased, but IMHO it is justified to be so.

Thanks for the recommendation ... however, I think there might be some
confusion, which I will attempt to straighten out :-)

Greg Kopchak (of It's All Relative) publishes Photo Show Pro,
which is software that lets you view photoCD images, which it
accesses via the standard TOS file system.

Roger Burrows (of Anodyne Software) publishes ExtenDOS Pro, which
is an extension to TOS that allows you to treat a CD-ROM (including
photoCDs if the CD-ROM drive supports it) as a removable cartridge
with a TOS file system on it.

Therefore, if you want to view a photoCD image from a CD-ROM, you need
both Photo Show Pro & ExtenDOS Pro (or equivalents). If you want to
view a photoCD image from a floppy or hard drive, you just need
Photo Show Pro.

This confusing public announcement was brought to you by Anodyne
Software, who of course are totally unbiased about CD-ROM software.

Roger Burrows

Looking for a little bit of net.trivia... Who was the very first moderator of comp.sources.atari.st ? Here is what I know.

The group was created in March of 1988 ?? __________ was the group's first moderator. Shortly after however, Steven Grimm took over as moderator. The group had not been archived in any organized way. Steve reset the volume and issue numbers to prevent later confusion. He was the group's moderator from March 1988 until December 1993. Annius Groenink took over as moderator and began posting at the start of volume 7.

Any ideas what name should be used to fill in the blank ??? And yes, I've already asked Steve.

ID>I need an *English/US* TOS 2.06 as an *image* file *pretty urgently*!
ID>Any good Samaritans out there that can help me out?

ID>And to answer the two questions which will undaubtedly come up:
ID>- Yes, I am a registered developer and...
ID>- No, Atari doesn't care anymore...

ID>donm@ucon.gun.de
ID>donmaple@cix.compulink.co.uk

They might not care very much - but if they DO decide to prosecute, both
you and the person who supplied the file will be found guilty of
copyright infringement.

Why not just buy the ROMs and make your own image file? That's _legal_
- and you can't accidentally erase the ROMs.

I have not heard of such colour restrictions yet. Ask the developer for
details, but AFAIK a TC board will support TC graphics.
-> Stephan_Skrodzki@ka.maus.de

>1. Has anyone here actually performed this modification?

Not me, but I have heard of many who have.

>2. Doe this modification require a VGA monitor or can a SC1224 be used?

Who the hell wants an RGB monitor anyway? Nope, a SVGA monitor is needed,
for it is an SVGA board.

>3. Does anyone have an English language version available? (My German
> is very limited)

The developer has, AFAIK.

>4. What is ET4000? Is a graphics board or a graphics standard? Is
> it available in the U.S.

Tseng Lab ET4000 graphics processors have been put on many cheap SVGA
boards.

>5. Does this modification work on 16Mhz 68000 machines?

Dunno.

But. you will need a driver. A complete VOFA package incl. NVDI/ET4000 will
cost you 490.- DMs (approx. 200 Pounds/ 330 US Dollars). And don't forget
that _no_ commercial game will run on the board, and demos won't either,
but any GEM or TOS program will, including games like GNUchess or Nethack
3.13GEM (256 colours max., for in HC one can't see anything (deep purple on
black :-().

|It took Atari 4 years (from 1985 to 1989) to release TOS 1.4, which
|was basically a bug fix of TOS 1.0 (1.2) that would fit in 192k ROMs.
|And despite this length of time, there were still bugs (although not
|as severe) and a smal but significant number of programs were
|incompatible. Although there are many other reasons for why it took
|so long, one might have been the 192k restriction. Optimization is
|also much more important on a platform like the Atari since the TT
|(Atari's only machine that offers a significant amount of raw compute
|power over the original ST) is a tiny share of the Atari market.
|

During the 1985 to 1989 timeframe.. Atari released the 520ST, 1040ST, the Mega2 and Mega4 as well as work on things like STPad and STBook as well as the ST Portable. When you add the Laser Printer, GDOS, the CD-ROM player, and some networking stuff that never made it, you have quite an array of hardware projects that were produced.

For each one of those computers than was released, TOS had to be brought up and tested on each one. This took time. In the case of the Mega machines, this meant a BLiTTER chip. The addition of this chip required a complete rewrite of the lower levels of the VDI subsystem.

When you consider than Atari had a staff of about 12 people working on TOS (at the most, usually less than that).. you begin to understand that we are dealing with a resource problem. Atari simply didn't have the staff to do everything it wanted to do. Now, remember.. I am not slamming Atari for this. Every single company in the world has this problem. They have to make decisions on what they need to do and what they have the resources to do.

So, please.. don't get the idea that the engineers at Atari were sitting around drinking coffee and playing video games during the four years between TOS releases. They were actually doing alot of stuff.

IN> Does anyone knows how to save time after turning
IN> computer off ?
IN> Neven

The cheapest way is to use one of the timeset programs that run from the
AUTO folder - and just set the time whenever you boot up.

Alternately, you can get one of the ST-Time cartridges for the easy
method.

we> Okay then, run GEM-Bench. Then run MiNT, and then run GEM-Bench again.

OK. I ran the NVDI test program as well as GEM bench. I even posted
the results. In most areas the results were the same - some areas were
even *drastically* improved (gemdos text/minix filesystem/isofs cdrom
driver). Overall speed was very good.

we> Notice a large speed loss?!

Not at all.
I include the summary here from GEM bench;

GEM Bench, TOS:

GEM Bench v3.40 © Ofir Gal 14.1.94
==========
TT 030 TOS 3.06, MiNT not present
Blitter not present, NVDI not present
Video Mode = 1280 * 960 * 2 Colours
LineF FPU installed
Run and Malloc from FastRAM
Ref = TT + Fast RAM + FPU, ST High
========== This context
Graphics: 98% 100%
CPU: 103% 100%
Average: 99% 100%

GEM Bench, MiNT

GEM Bench v3.40 © Ofir Gal 14.1.94
==========
TT 030 TOS 3.06, MiNT 1.0B
Blitter not present, NVDI not present
Video Mode = 1280 * 960 * 2 Colours
LineF FPU installed
Run and Malloc from FastRAM
Ref = TT + Fast RAM + FPU, ST High
MiNT version 1.11

========== This context
Graphics: 102% 104%
CPU: 97% 94%
Average: 100% 101%

The "This context" lines should be explained... I let the standard environment without mint be 100%. The mint results in the "This context" should be read as the speed difference between a system with/without mint.

As I have allready posted the complete results to this list, I only send you my data as email. You are of course free to upload them again anywhere.

Compiling with 2.5.8 will cause troubles with the mouse - atleast on
AES-4.1. It leads to the mouse being locked - and even system crashes.

If you compile with gcc-2.3.3 everything will be fine.

Ahmm!. If you have an older version of Cubase, then you can easyly upgrade
to a newer one. Only takes a few quid to upgrade. And you do have the key
right ?

>>I have a 68020 (and 68881) in my MegaST4. Can someone give me a good MiNT

> Can a 68020 be installed in an Mega ST 4 ?? How ??

Yes it can. Get a PAK68/2. Or a PAK68/3 and you'll have a MC68030/MC68882
in your MST.

As to the original question: compile MiNT using the -m68020 compiler
option. If you want an even faster MiNT, compile a new MiNT library using
above switch together with -m68881 prior to compiling MiNT.

As soon as I can lay my hands on the new MiNT sources (1.12?) I'll be able
to give you a binary. As it is, I'm stuck at 1.09, and this version may only
be distributed in source form.

generation of games such as obsession and Zero-5?

> Can anybody help?

The TT's MC68030 processor has a barrel shifter and doesn't need a
blitter.

As to games, many are dirty hacks, making assumptions about the underlying
hardware. Those are a good test for the rubbish bin icon, or the rm command,
if you use a shell, like I do.

Yes, this can be done, Falcon connections same as STe, IIRC.

>A last question: Is it possible to *remove* the RIAA-amplification on the

>stable. So what's the deal?

There appears to be a problem compiling proc.c with gcc 2.5.8, independent of the processor type (i.e., bug exists for both 68000 and 68030 code). We haven't got too many details on the exact problem just yet. The problem also seems to only manifest when running AES 4.1 (MultiTOS). Needless to say, we're pretty eager to find what the problem is... Since it appears with both the 68000 and the 68020 code generation, it's likely to be a bug generic to GCC's m68k support, and therefore may still be present in 2.6.0 and 2.6.1, though I don't know for sure. (Haven't looked at any recent GCC ChangeLogs to see what's been fixed...)

3350. seeking Carlos Varela (German 2 English author)

Newsgroup: comp.sys.atari.st
Date: 1994-11-19 04:41:11 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <ps91spn.johnhechtman@delphi.com>
Source record: 176607

I'm looking for an email address for Carlos Varela (the author of the shareware program German-to-English). About a month ago I sent a s/w payment to the snailmail address listed for him in Canada, as of yet the letter has not been returned and I've not received a registered version of the program.

To make matters worse, I was foolish enough to send him an International Money Order rather than a personal check. I thought I''d make matters easier for him, since I'm a US resident and he's Canadian.

I've had such good experiences with other s/w authors that I was off my guard. The payment was only $20 US, so I'm not out _too_ much money, but it's frustrating not getting what I've paid for. I want to use G2E to translate docs for German s/w, I'd hoped that the registered version would do a better job than the s/w one. The s/w version creates a lovely word salad that's _almost_ understandable (sigh).

If anyone knows of a way to contact Carlos, I'd appreciate knowing it, by either post here or email. I'd like to try contacting him before I say in a public forum that I've been ripped off. Who knows, maybe the Post Office lost the letter or something? Thanks to all in advance for your help!

> go about it?
> ....
>
> PS: and don't say sell them and buy 4 1 meg simms instead....

I'm afraid, then, that you won't like the answer you're going to hear.

The STE's are designed to take SIMMs in matching sets of two, period. Up to two sets of SIMMs may be installed. In most cases, all the SIMMs must be of the same amount of memory (i.e., 256K or 1 meg), though a software hack is available which allows mixing of two 1 Mb SIMMs and two 256K SIMMs for a total of 2.5 megs.

I'm afraid you're only option with those 256K SIMMs is, most likely, to attempt to sell or trade them to obtain 1 Mb SIMMs.

Another option does exist, but you'll have to do the research to get the details. I've seen a company in the Computer Shopper (a U.S. magazine about the size of two phone books) which will take your old DRAM or SIMMs and combine them on a custom SIMM board in order to make larger, individual SIMMs. For example, they could take eight of your 256K SIMMs and make two 1 Mb SIMMs out of them. The cost was very reasonable... about $13.50 to $18.00 per new SIMM. If no other options exist, this may work for you. Sorry I can't provide details on the company, though...

>roughly in pounds sterling is one going to cost me ?

>PLease reply to dl533@city.ac.uk

The "normal" PC drive can either be SCSI or PC specific. You require a SCSI
CD ROM Drive, bare drives start from 150 pounds but check the spec as some
drives are not able to do multisession Photo CD or direct read of music CD
data. I have a Toshiba XM3401B which does both and cost 230 pounds.
If your Hard Drive case is big enough you can pop it in there, set the SCSI
id and thats the hardware done!
You will also need software to access the CD ROM. Extendos is good and will
do multissesion Photo CD.

> roughly in pounds sterling is one going to cost me ?

As I see it you have three alternatives:

1. Get a "plug-and-play" external CD-ROM from some Atari-supplier.
This is definately the easiest solution, but also probably the
most expensive one. You will also have a very limited choice
of what drive-unit you want. If you want quad-spin and/or
portfolio-support this is probably nothing for you since these
"plug-and-play" units most often contains the cheapest possible
doubble-spin units.

2. Get one of those TOS-cards that comes with an IDE-interface plus a
IDE CD-ROM. This is probably the cheapest solution.

3. Get a SCSI-adapter (preferrably one that supports SCSI2) and a
SCSI CD-ROM. This will cost you more, but on the other hand you
will also be able to connect lots of other SCSI-devices.

In 2 and 3 you have to either put your ST in a tower-case or get
external drive-units (which are more expensive). Prices aren't my
department, so maybe someone else can supply you with current
prices in the UK.

You also need driver-software in order to use the unit. Personally
I use CD-Tools from Hard&Soft in Germany to accompany my SCSI2 CD-ROM
that I have hooked up to my Falcon. Works very well!

Why don't you install Linux on your PCs? This gives you the opportunity
of using them as full-fledged Unix machines, plus using them as Xterms,
all for no cost! And, in contrast to Windows, Linux is _stable_! Have
a look ... (Of course it depends on what you want to do with these
machines.)

M>I would like to know whether is it possible to copy pictures on the
M>clipboard to pass them to other programs to use those pictures.

Sure. The program you're using has to support this of course. In general all kinds of formats can be stored in the clipboard. Texts, pictures, databases, spreadsheets, etc.

M>Are they any programs available for STs similar to the Clipboard Viewer
M>in Microsoft Windows?

The clipboard on the Atari ist simply a directory on your harddisk. Usually this is c:\clipbrd. So just open the directory and have a look. If you install a fileviewer on your system, you can just dubleclick the files in the clipboard to see them correctly.

M>How do I copy graphics to the clipboard if it is possible?

Use a program that supports clipboard funktions, then do cut, copy, paste as usual.

Oliver.

:] the ROM AES, apparently even with memory protection switched on.
: You mean there's been a check routine put in for a 030? This is a
: big thing!?

No, it's more than that. Apparently the system watches for accesses from
the ROM and makes allowances when it breaks protection.

: I'm surprised Atari is touting Multi-TOS as it's great Multi-tasking
: system, the Kernal they use is too slow to me of much good. Sure,
: on a Falcon or TT it doesn't matter too much, but comparing Geneva
: or Magic to it on any machine, and it certainly shows how much better
: they could have made it!

Geneva is not really comparable - it's a cooperative multitasker and is really very limited in scope. MagiC _is_ much faster, but also strips out practically all of the more advanced features of MiNT - although I will be looking out for the newer versions, which are supposed to have much more of the functionality of MiNT.

MagiC, however, will have to come along a long way before I can set up the system I currently have with it as a kernel. My system feels like the Unix systems I am used to on login. I can log in under either my username or root and use something more or less exactly like BSD 4.2 with long filenames and a fast, secure filesystem. I can compile up most of the vast library of Unix software available without hassle. If I want to do GEM work I either type gem.multi or gem.single to launch either AES4.1 or the ROM AES respectively. I'm going to install MiNTnet, and, if I can get a connection out of the university will have flexible internet access system-wide.

Could I do all this with MagiC? Not for a while yet, I think. I know that I'm not what you might class a 'normal user', but it still holds. MiNT is an excellent way of _extending_ your system. Mag!x or Geneva are good for people who want to multitask GEM programs. I think Atari made the right decision.

: Okay then, run GEM-Bench. Then run MiNT, and then run GEM-Bench again.
: Notice a large speed loss?!
: I'm talking about JUST Mint, the executable and nothing else!

OK, two questions:

a) Which version of MiNT (try 1.12, available from virtually everywhere
now)?
b) If you used the one that came with MultiTOS, did you edit mint.cnf
to stop it running the Multitasking AES?
c) Try doing a fair benchmark for the _kernel_: run a TOS benchmarker.
Put EXEC=/bin/tcsh or a pointer to some other shell in your mint.cnf. Run
the benchmarker again.

I consider "reasonable" floating-point performance to be something close
to (.8x SPECint) = SPECfp for a chip. '486dx chips have about .5x,
which is terrible.

>wonder what you run. You must take it upon yourself, then, to believe
>YOU run a system that gets reasonable floating point performance
>(Pentium-class performance) that does NOT run DOS/Windows. I'd like to
>know what you are running, then? Won't you share that with us??

At home, I run a nice 8Mhz 68k (wow, 1 MIPS!), which has no
floating-point performance at all. At work, I run a '486dx2/66, which
has bad floating-point performance. At work, I also run a
dual-Pentium/90 system running UNIX, which gets ok floating-point
performance.

PowerPC, MIPS, Alpha AXP and PA-RISC chips all get good-to-great
floating-point (PA-RISC gets close to 2x SPECint as it SPECfp numbers!).
Granted, PowerPC is enough for me, a 1x relationship.

My next system will be RISC, and it certainly won't be running
DOS/Windows. It'll be UNIX, too.

UNIX is not huge, it just comes with a zillion great utilities (you
know, "useless" bells and whistles like networking, compilers, etc).
Most modern UNIX kernels are around 1M, aren't they? Now, when you add
networking, pre-emptive multitasking, etc to your ST, MiNT is sucking
back about 1M just for itself, the network extensions, minixfs, etc.

I guess now you'll say MiNT is huge and inefficient.

>Define 'more productive'. Do you get more work done faster? Is it

>are in the OS or in my library.

I'd certainly be more productive if I had a cross-compiler running on a
faster computer; it takes me ~6 minutes to compile a C++ source module
on my Atari, _if_ it's small enough to compile in "only" 4M of RAM.

One of the many, many reasons why I haven't "upgraded" to a '486 system
running Linux is that I'd only use it for networking (UUCP and possibly
SLIP onto the Internet), cross-compiling, and a little ray-tracing.
Definitely not worth the effort or the cost, though it would be neat to
NFS-mount the drive of the Linux box on my Atari, and telnet to it for
cross-compiling my GEM++ apps, then run them off the NFS-mounted
drive...

>People who I know who develop for both Atari and Windows have almost

After programming GEM for so long, there's no way in hell I'll ever
program Windows or OS/2. I have no idea how nice or gross X is to
program, though I imagine Motif is just as sick as Windoze (but without
the stupid "near" and "far" pointers, and 64k segments).

Microsoft's C is brutal. I was just trying to help a guy yesterday; no matter WHAT we did, we couldn't get MS C 7.0a to print out "unsigned long" numbers properly; it kept printing either unsigned shorts or signed longs, which were way off...

>Compare "hello world" programs:
> 68000 ASM: 92 bytes

Strange, wouldn't it be closer to ~560 bytes if you did it properly? I mean, if you shrunk your memory chunk and all that?

> Laser C: about 6k
> Borland C: about 12k
> DBase III: about 100k

That's a pretty stupid comparision. Who writes "hello world" applications? I mean, beside FSF? :)

>Doubtless, Microsoft visual C++ would produce something on the order of
>40 or 50k.

C++ produces huge "hello world" on any platform with any compiler. It's because we're still using C linkers that include the whole object instead of just what you used; the C++ stream objects are pretty large because they do a lot of work.

>You should NOT need more memory simply so you can run your OS. More
>memory should be there for the USER so he can make more effective use of
>his system. As a result of inefficiencies in OS design, you get nothing
>out of 16 megs with Windows NT, while you can't fill 16 megs of RAM on a
>TT, even while running several programs at once.

Ah, but due to the stupid memory design of the TT, there'll be at least 2M of "ST RAM" sitting there doing nothing but holding the screen data (assuming you're not using a video card) and doing ACSI DMA...

>I agree that development time is important. As a result of my
>application framework that I use for my Atari, my applications have a
>minimum size of about 26k, rather than about 12k for programs that had to
>be developed from scratch and took on the order of 10 times longer to
>develop. That 20+k library is a worthwhile sacrifice.

The overhead of object-oriented programming (slower compiles, larger executables) is worth it, too, no matter what platform you're working on. I can produce a GEM application with 1/2 the work, and about 1/8 the hassle using GEM++ than I could using *any* GEM library written for

C.

>On the other hand, when an OS is so large that your size sacrifice is on
>the order of megabytes or tens of megabytes, then it IS laziness. There
>is no other reason for the flagrant inefficiencies in Windows and System
>7 than simply extremely lazy developers. Maybe not the individual
>programmers, but the company that pushes the programmers to develop
>software that may come close to working, regardless of size or speed.

I think it has a LOT to do with trying to kludge something modern onto
something incredibly crappy, like DOS, or the original Mac System.
These days, backwards compatibility is crippling _hardware_ design, not
just software design.

>This was back in about 1970. Over 24 years, Unix has grown
>continuously. Independant contributors each developed utilities some of
>which had overlapping capabilities. Additionally, the core of the OS has
>been improved and adapted to countless different systems and
>requirements. Memory protection, threading, and virtual memory were
>certain not part of the original design of Unix. Considering the time
>it's been around and the number of contributors, I'm surprised it's not
>larger. The biggest reasons that Unix is so efficient is that is had to

With increased functionality comes increased size. Look at DOS; it
doesn't do anything, and it takes up less than 64k.

>The large apps and OS's being produced by awful companies like Microsoft
>are that large not simply due to an interest in reducing development
>time. It's due to stupidity and the fact that they can fool most idiot
>Americans into buying any crap they want to sell. It's like selling
>refridgerators to Eskimos, except Eskimos probably have some intelligence.

I guess you'd rather wait two years for me to develope a tool in C (and
have it maybe 20k smaller for a non-trivial application) than to have it
done in 4-6 months in C++... Personally, I develope things I want to
use, so I want 'em done as fast as possible. Once it's working, then
maybe I'll think about making it smaller and more efficient (that's what
both IBM and MS did with OS/2 and WindowsNT... the latest versions are
smaller and faster than the older versions, not that anyone sane would
bother with NT).

for sale,

Atari 520ST 512k ram (i think, could be 1 meg, but i can't check)

Work perfectly,

Atari SC1224 monotor -- works good.
Atari SF354 disk drive -- works well.

E_mail me a reasonable offer, COD shipping will be prefered, all items
are sold as is and are working perfectly up until shippment.

thanks.
bryon

From: Bill Repetto <brepetto@delphi.com>
Message-ID: <JG228B8.brepetto@delphi.com>
Source record: 176551

I recently got a Megafile 60 for my daughter's 1040 ST (stock version with TOS 1.0). My problem is that when I try to boot the machine I get:

```
Loading
Atari Hard Disk Driver
AHDI 6.05c May 25, 1993
ACSI Devices:
Unit 0 - Identification unavailable
Unit 1 - Not responding

Bootloaded

The infamous 4 BOMBS
```

What do I have to change to get this working? Does the driver software need some new information (I bought the drive used from someone here on the net) specific to my system? Any help would be appreciated.
Bill R.

3382. Trouble with floppy

Newsgroup: comp.sys.atari.st
Date: 1994-11-19 22:12:31 UTC
From: al743@FreeNet.Carleton.CA
Message-ID: <CzJCCv.471@freenet.carleton.ca>
Source record: 176595

I have been using an Atari 1040ST, that occasionally wipes out a directory (sometimes a subdirectory, sometimes the root) on the floppy. I don't believe the problem is in the application program, because it's happened with a number of different programs. Has anybody out there experienced similar troubles? Can anyone give me a clue where the problem may be? (It could be a bug in TOS, or it could be hardware problem in the drive.)

Bob Lantos, al743@freenet.carleton.ca

Is there any chance that you have some corrupted program in the AUTO folder
or an errant .ACC? You could try running the AHDI driver manually from
a floppy (boot the system with the hard drive turned OFF; power it up when
you're looking at a floppy-derived desktop; run AHDI; start renaming AUTO
programs and accessories until you find the culprit.)

This is just a guess, of course...

3387. Ace '95 In Toronto!

Newsgroup: comp.sys.atari.st
Date: 1994-11-20 02:55:00 UTC
From: dan.dreibelbis@balmybeach.tor250.org
Message-ID: <4ae6ab81@balmybeach.tor250.org>
Source record: 176562

Well, there's been some interesting developments in Toronto this week.

Seems the Atari users group I belong to, the Toronto Atari Federation, has started preliminary plans for a followup to the very successful Atari Canada Exposition (ACE) we held back in '92 in Toronto - to be held in the spring of '95.

So far, there's been quite a bit of positive support from a variety of Atari software and hardware developers (yep! they still exist!) both in Canada and the US for us to put on this show.

Who knows, if this post gets out far enough, we might get some international developers interested in showing off their newest developments designed to make our choice of computers strut their stuff here in North America (well, the Great White North, anyway) :).

Maybe if we're lucky, Atari themselves could be persuaded to show up and show off what they've been up to lately. (If you remember, they were showing off the Falcon to dealers and developers at the '92 show). Even if it's just the Jaguar, they're more than welcome to participate.

You'll also probably see ME there on the bandstand, flailing away on my guitar like I did in '92 with a hastily prepared band I volunteered to be a part of. Only THIS time, I'm coming loaded for bear. :)

More news as concrete facts develop......

If you want to get it straight from the horse's mouth, or if you're interested in doing something to support an ACE '95 (by volunteering or wanting to exhibit) - get in touch with TAF at

Hi Neven.
I haven't used Jekyll for a while but it worked fine for me.
I didn't send any init. string to the modem.
I rang my friend, we both got Jekyll ready and then I typed ATO and he typed
ATA and we both hungup. The modems squealed, squarked and connected fine.
I'll email you my cfg file and see how you go.
Regards, Julian.

Ok people, I'm an Atari dimwit since I've never really liked them, except for collecting purposes and the Atari 2600!

I have been given a whole pile load of Atari 520STs (2 of them). I have a 520STfm and we have a 520ST (1 meg RAM!!!) and another 520ST (512k) which I had but never used.

Is there any chance of upgrading TOS or any chips so maybe we could get it up to STe specs? I really want (for some unknown reason) to get this working.

Is there any reason why Atari designated the 354 to be single sided and the 314 to be doule sided?

Maybe, but I know the first time I saw Encarta, I was blown away not
by the graphics or the sound-bites etc. It was the ability to follow
chains of thought among subject areas easily and actually learn
something in the process. In other words it made learning easy and
fun! This is something that a book encyclopedia just doesn't do for
me. It's there for use sure, and if I need to look for something I
will; but I don't actually get any real desire just to sit and
browse/read the thing!

Cheers,
John

For Sale: SyQuest drive kit.

1 SyQuest SQ555 44 meg internal SCSI removable drive,
2 SyQuest 44 meg cartridges,
1 internal SCSI cable,
1 8 bit Future Domain 840 SCSI control card,
1 installation disk,
NO owner's manual/user's guide.

Asking : Best Offer.

It works fine. I just move to use the optical drive for my PC, instead of
using this kit. Please email your responses to jteng@umr.edu.
Thanks.

>
>Bob Lantos, al743@freenet.carleton.ca

It could be the disk change problem, some disk drives don't tell TOS
that the disk has changed, the Atari Chinon drive is the suspect one,
but not all..

OEM drives can also be a problem..

There is a software patch called media change thing bug...

The other mod was to short out the disk in switch, but that make the drive spin
all the time its selected...

Just some food for thought....

: >-scott tirrell

: My replies are to people that insult me, or insult other people,
: I have had a number of good E-mails regarding the Insults to JOHN TOWNSEND,
: including one from John himself...
I for myself have also a number of positive replies to my open letter. I
also have a short one from John Townsend, telling that he has posted an
answer to the letter in comp.sys.atari.st; you know, I believe him, he
wrote sth and forgot to press the "f" or "w" key in tin. Well, but then
again, this might remind people of software "support" from Atari, when he
was working there.

: If you don't like what I post then stop insulting John and other people here...
The insults started from you. People never denied here, that Ataris today
are on the hardwareside and on the softwareside (TOS) outdated. However I
tried to point out, that there are some people working on TOS compatible
operating systems for Atari computers and Macintoshes and that neither you
nor John have the right to attack, wo. proper knowledge, the programming
other people do, especially, if John critizes very emotionally the lack of
features that actually do exist. On the second side, the comments towards
John regarded DIRECTLY his work at Atari, not, if ataris are good and bad,
and some people simply want to know, why John, as a responsible at Atari at
that time, did not succeed at all in support and development of TOS.

: Its tuff if you can't live with the demise of Atari, but that is the way it
: goes...
Actually a lot of people are living very well with the demise of Atari...

: Fed up with Insulting posts myself....!!!!
Agreed

: Well reply No. 2...

: I am a blunt person, this is my nature and I am to old in the tooth
: to change..
The use of vocabulary and of language is a a distinctive mark between
people with proper education, culture and manners and the rest. It is not
meant as an insult, but as a "true fact of life", that you (Roger) do
sound more like a sailor-men sitting with a bottle of rum somewhere in
the docks of a harbor, no future, little money given for the work done during
his life, but not tired to clinge onto your last piece of pride, your
knowledge about...
: I also don't pull any puches, but I do tell the truth, if you can't stand
: the truth you should not realy be in this group...
truth and life. Take a stand, Roger. It is people like you, who nourish
some guys over here in Europe, who think that people overseas have no
culture and proper manners

: Its about time Atari users take those blinkers of, and find out there is no
: more Atari computers, Atari droped out way back in 1993, it was even
: posted here from a Article in a USA news paper...
Yes, they dropped out, they might come back some time, they might not,
they might even disappear at all. Remember Roger and John, however, that
the Tramiels have made millions of dollars of money with their companies
and that John and you are just two small, unknown employees. You should
not forget that fact, when you are speaking of "truth" about Atari Computers,
"facts of life", "business and profit" and so on and so on.....

: *** Will it be PowerPC compatible?? (Wooow) ****
Yes it is true. ASH in Germany are porting the operating system (Note: it
is not an emulator) to the Macintosh, the first version running only on
680x0 Macs, a PPC version will follow. The functionality will be more or
less the one that is expected for Magic3
It will have
an AES with 3d look, Iconify, Drag and drop, so basically the features of
Atari AES 4.1
a Multitasking kernel with MinT extensions, such as Pipes and loadable
devicedrivers and filesystems.
As oppsosed to a PC emulator, Magic3 will include a Macintosh
filesystemdriver, so that Atari applications can take full advantage of
long filenames etc (the MAC.XFS will probably also work with atari machines).
CCD (the makers of Tempus) have stated that the editor is working wo.
modification on Magic Mac (as it is called) and that the speed is about
10% less than on Ataris with comparable CPU (ie, a 68040 Mac is much
faster than anything Atari produced runing Magic). However, this is still
prerelease data. Magic Mac will be shown (and probably also sold?) at the
ProTOS fair in Bonn, as will the Atari version, Magic3. Together, ther
will be a new version of Ease (3.5).
So, get to the fair..... :)

Quantity, no quality...

>A powerful computer (by today's standards) with all the software
>available that one could dream of. The best BANG FOR THE BUCK one could

There are lot of software for e.g. Falcon, which has innovations and quality
that has never been rivalled by PC-programmers.
You must be talking about the dreams of a average user that has very limited
expectations, does not know much about software (apart what he's seen at work)
and thinks that Ami Pro is a DTP-program...

One excellent program will be enough to justify the purchase of a computer.
Getting 10 000 programs you don't really need does not.

>
>Must be abled to use as a PRG or TOS program...

The best PRG (GEM) filesearcher is FSEARCH 7.4. It has all the methods
(e.g. looks for text "shiit" inside write protected files that are
larger than 5 kb and were saved between 8.00-14.30 before last
christmas) and it makes a list of the found files (and displays
the lines inside files that include the found text).
By double-clicking the items in the list you can start
programs of look pictures etc..

It works as ACC or PRG.

It can also do the normal filesearching :-)

If you cannot find it from ftp, write Email to the recent author:
mdavidsona@compulink.co.uk (you could try to persuade him to do a
TTP-version of it).

3415. Re: Shareware or not Shareware

Newsgroup: comp.sys.atari.st
Date: 1994-11-20 12:22:07 UTC
From: diehl@nudge.io.org
Message-ID: <3anf1f$ro7@ionews.io.org>
Source record: 176585

As far as producing shareware is concerned, typically I don't expect any amount of quality, but of course it never hurts when I see something of extremely good quality come out of the Shareware market. For me, and my programs, I try and put every effort into my software to ensure that it is at least of decent quality. As far as price is concerned, I typicalyl charge between $10 and $20 for my software, usually settlinmg on $15. Is it worth it? It can be, but that depends on what sort of a program you write; different programs appeal to different audiences, and therefore generate different amounts of registrations from people. My ANSI editor FANSI for example appeals to a somewhat limited audience -- mostly BBS SysOps -- and so registrations have been somewhat lacklusstre. I ccan't comment on the profitability of games as I havn't yet released any -- though I am working on a few. But again even there you have a whole different genre -- it depends again on what _kind_ of a game it is and how well it's written. When you're charging money for a product that someone is bound not to like, it's difficult to gauge exactly what you _should_ be expecting in terms of registrastions because there are too many factors involved in doing so. It can make you money, dependsibn on how much you charge and what sort of product it is and how well people like it and how popular it becomes. Me, I producve Shareware not because I hope to get rich off it -- I'd be a fool to think that -- but because I enjoy the software I write -- I write software that I myself want to use/play.
And that itself makes it worth it.

: I don't understand why people are still arguing about this. There is *no*
: question that the average PC (DOS/Windows-computer.) have several advantages
: over a normal Falcon.

: 1) It's a lot faster.

Granted; but that can be readily ameliorated by the purchase of an
accellerator board for the Falcon...

: 2) It's got slightly better (But not very versatile) graphics cards.

Falcon's video modes are programmable.

: 3) Better sound (Most people have a SoundBlaster or a GUS.).

The DSP kill ssoundblaster.

: 4) Better keyboard (Which is quite important.)

I much prefer my ST's keyboard.

: 5) Cheaper hardware.

The Falcon uses standard SCSI-2 and IDE hard drives. No advantage either
way.

: 6) More software available.

This is true; but the PC has its entire software libreary available at the
expense of backwards compatibility back top its 8-bit days, which has
severely hindered the PC's advancements in terms of raw power.

: Anyone who hasn't understood this propably owns an Amiga...

: So what? I use a lot of different OS/computers, but I prefer my Falcon. OK,
: the PC's are faster, and the SGIs at school are "better" in every sense, but
: IMO they suck. I've got the programs I want (Hey, I've even paid for some
: of them!), the OS is so much faster and nicer, and I've got lots of friends
: with Ataris. So if anybody thinks that the ultimate thing is to own a PC because
: that's what everybody else owns, they have missed something. The lack of
: individuality makes these people pathetic...
:

True ... I prefer my ST to the PC in every way. I've used PCs extensivey
and have _never_ liked them ... I don't like the OS (any of them), I don't
like the architecture, and I most certainly don't like the complete
modularity of design. I'll stick with Atari; they have everything I want in
a machine, and it does things the way I want to do things with a minimum of

fuss; the PC is nothing but constant editing of your AUTOEXEC.BAT and
CONFIG.SYS files.

Ok, 2 things.

1. Just because someone doesn't use a multimedia encyclopedia doesn't se
illiterate. To suggest so shows an alarming definition of literacy.
For example, I consider myself literate (lots of qualifications, inc
degree/doctorate), but I've never used one of the things. As for using
them for research, it sounds limiting to me, not appealing.

2.In reference to your last sentence, may I suggest you look up the

Source record: 176594

Announcement to those (few) who mirror phlem's ftp site.

The disk structure has (slightly) changed from the previous layout.
All
atari-related s/w has been moved to ~ftp/pub/atari from the previous
location of ~ftp/pub. This is due to the site being expanded: in the (near)
future we'll be calling it ftp.ph.kcl.ac.uk and putting it onto a 9gig
disk, to let me put more stuff on.

At the moment, the previous layout has been preserved using links so
no
mirroring s/w should barf, but this will be removed fairly soon (in a few
weeks).

Just thought you might like to know :-)

ATB,
Simon.

>I don't understand why people are still arguing about this. There is *no*
>question that the average PC (DOS/Windows-computer.) have several advantages
>over a normal Falcon.
>
>1) It's a lot faster.

Depends; most PCs have pathetic disk performance... the Falcon can blast
2M/s _easily_ over the SCSI bus if the disk can perform that well.
Unless you've got a PCI or VLB video-card, the graphics can be pretty
bad, too (but the Falcon's graphics are incredibly slow, thanks to the
stupid architecture).

>2) It's got slightly better (But not very versatile) graphics cards.

AFAIK the Falcon has _no_ graphics cards. The VME systems (TT, MegaSTe)
have essentially the _same_ graphics cards as PCs (most are
ET-4000-based cards), but they cost much, much more.

>3) Better sound (Most people have a SoundBlaster or a GUS.).

SoundBlaster-16 is about the same as a Falcon (except it sucks back
CPU time to play sounds), and the GUS is AFAIK much worse (isn't it an
8-bit card?). Recently-released cards blow the Falcon away (32-bit
systems with DSPs built-in), but they're still not as flexible as the
Falcon's DSP system.

>4) Better keyboard (Which is quite important.)

Not on most clones I've seen. I've only found _one_ keyboard that's as
good as my ST's keyboard (I _like_ the mushy, quiet keys), and that was
an NCR keyboard that isn't made anymore... now they use those crappy
clicky keyboards that most cloners use. It's only slightly better than
the IBM PS/1 keyboard, which is TERRIBLE.

>5) Cheaper hardware.

Not if you want a decently put-together system. A '486 or Pentium
system with good components and reasonable amounts of disk and RAM (like
16M of RAM and 500M disk) costs as much as a similarly equipped UNIX
workstation with better performance.

>6) More software available.

Not if you run OS/2 or Linux or NEXTSTEP or any other operating system
worth using. Sure, there's plenty of crap available for DOS, but DOS is
a liability.

>Anyone who hasn't understood this propably owns an Amiga...

Personally, there isn't a "personal" computer on the market that I'd buy
right now. In the early '80s, the Atari ST and the Amiga where awesome,
and soundly kicked the butt of anything else available. These days, all
you've got are PCs and Macs that aren't really that much different from
the systems of 5-8 years ago. Sure they're faster, with better
displays, but they're running the same operating systems, the same
software, etc. Nothing's changed, not like the amazing shift we had
going from 8-bit systems to 16-bit systems. The shift to 32-bit systems
wasn't a shift at all, thanks to Apple and Microsoft.

SGI's machines are definitely great. It's a pity they're priced so
incredibly high in Canada... a base-line Indy system, which is around
$5000 in the US is almost $10000 here in Canada!

HP's workstation prices are similarly inflated up here, too. :-(

The Canadian market is almost totally dominated by DOS-running PCs right
now; even Macs don't have much marketshare up here. Truly sad.

>Studio, Midcities or whatever and they'll be able to deliver you one..for
>a price that's not quite right IMHO but .. ah well :)

I don't think anyone still sells TTs in Canada. Pity. And the price is
a bit more than "not quite right", too... especially when you realise
you have to add a graphics card to get a decent system.

TT030, 2M ST RAM, no disk = ~$1500 US isn't it?
ET-4000-based graphics card = ~$ 800 US
17" Sony Trinitron monitor = ~$ 900 US
8M TT RAM + SIMM adapter = ~$1000 US
400M SCSI external disk = ~$ 600 US

Total ~$4800 US = ~$6240 Cdn

Ouch! I'm guessing on prices, but I don't think I'm really that far
off.

>I don't hope you are subscribed to `junk', too?! ;)

I'm not actually subscribed to either, or I'd be flooded... Hermes is a bit stupid, and posts all "cancel" and whatnot messages in any newsgroup into control; any post to an invalid newsgroup (ie, something that shouldn't show up at my end *anyway*) gets dropped in junk. I've usually got a couple dozen control articles, and about 2 junk messages (sometimes I post to groups I don't carry).

I got 3500 control messages because my UUCP partition got toasted, and Hermes didn't notice all the zillion bogus packets it had laying around... :-(Damn this DOS filesystem!

>Great news! One thing concerns me though. The readme.src file states
>that "gcc 2.5.x causes problems..."

It looks like gcc 2.5.8 (2.5.x, x<8 wouldn't work at all on 68000)
messes up slightly on _one_ source file in the MiNT distribution, which
makes MiNT not work properly with the MultiTOS AES. That appears to be
the only problem.

>Now I'm aware of problems with 68000 code generation up to 2.5.7, but
>2.5.8 is _supposed_ to be ok in this respect. Indeed, I compiled
>MiNT1.11h2 (no MultiTOS) using 2.5.8 and have found it to be very
>stable. So what's the deal?

It looks like a bogus optimization; that reminds me, I'm supposed to
send some code to Howard so he can go over it with a fine-toothed
diff...

Compared to _any_ other chip (well, except for the SPARC chip in a SPARCclassic), the '486's floating-point is terrible, about 1/2 the speed of the integer operations of the chip (going totally on SPECint/SPECfp results). 68040, newer SPARC, MIPS, PA-RISC, Alpha AXP, etc all slaughter the i486. It took Intel to the Pentium to get reasonable floating-point performance compared to the speed of the rest of the chip.

>totally crippled for DOS compatibility. What are you talking about?
>What hardware is crippled? A Pentium or 486 "totally crippled" for DOS?
>You been smokin' something you want to share?

All those PCI and VESA LocalBus cards have 8088 BIOSes on them. Know of any 8088-based systems with PCI or VLB? You can't even get '386-based systems with PCI or VLB! So why don't they have '386 BIOS code? Because DOS only speaks 8088. The Pentium and '486 would be much faster without having to be 100% backwards compatible with the 8088... hell, Intel could've even added a few registers to them then. The 8Mhz 68000 in my ST has more 32-bit registers than a 100Mhz Pentium does!

> What floating-point intensive applications do you run? What

>muscle, but really..... Must you condemn the rest of the industry on
>that basis alone?

I propose anything other than Intel, although the Pentium is a nice
chip... though, systems that actually take advantage of it (ex, AT&T's
System 3000 UNIX boxen) are very expensive.

'sides, the PowerPC's integer performance is (slightly) better than the
Pentiums, although they both pull approximately 1 SPECint per Mhz,
which is great.

If it runs DOS natively, your system is crippled; you'll only know about
it if you know better, though.

> . . . and all the comments to this message....
> Why dont ATARI-insider talk about the new ATARI?
> They have no permission!

More like, they have nothing to talk about. Atari's having a hard time getting the Jaguar CD-ROM unit out (and hell, they showed it what, two years ago when the Jag first came out?)... you think they're wasting any of their time working on new ST-compatible computers?

> Why dont talk Developers / dealers about?
> They have to sell their clones and MagiC / MacMagic

There are very few developers and dealers still doing Atari. They sell what they can get, but it isn't much.

> Why does not ATARI USA talk about a new machine ??
> They try to sell their Falcons and Jaguars, cause a new
> machine will be contain both . . . and more.

The Jaguar will sell anyway (hey, I'm not concerned with games on a new computer; I've got a Jaguar to play games on). The Falcon doesn't sell in North America.

> Cant you understand them ceeping silence about their BOMB they tries
> to fire on CEBIT , march 95 ?

You're much more optimistic than I am. I just hope they have the Jaguar CD-ROM out by then. :-(

A new Atari machine would be terrible, unless it used the 68040. *All* current Atari machines with CPUs > 68000 just use the CPU as a fast 68000, much like DOS machines use those '486 and Pentium chips like fast 8088s.

If Atari moved to PowerPC or any other RISC CPU, *all* applications would be emulated... who'd be re-releasing things like PageStream, 1st Word+, WordWriter II, Calamus, etc to take advantage of the new CPU? There are hardly any developers left. I'm sure the MiNT community would be overjoyed, and start producing RISC binaries the second the machine was released, but I doubt anyone else would do anything.

Knowing Atari, TOS would still be 68000, and emulated on the RISC chips, like Apple's MacOS is on the PowerMacs. :-(

>some decent assembler code thrown in, rather than good old slow C,
>it might work better.

That's the comment of a non-programmer, Steve. C produces assembly
code, and has a very good mapping from C to assembly. Are _you_ going
to hand-optimize all of MiNT for 68000, and then do it again for 68030?

Just putting MiNT in your AUTO folder will knock a whopping 3% off your
CPU usage for the extra overhead of multitasking. Warp-9 knocks off
something like 9%. I don't hear you complaining about Warp-9...

>I'm surprised Atari is touting Multi-TOS as it's great Multi-tasking
>system, the Kernal they use is too slow to me of much good. Sure,
>on a Falcon or TT it doesn't matter too much, but comparing Geneva
>or Magic to it on any machine, and it certainly shows how much better
>they could have made it!

Geneva certainly doesn't add anything to TOS, it's just an AES
replacement. Future versions will probably run as INIT= to allow
pre-emptive multitasking, pipes, and all that other great stuff; then
you'll have to complain about something else...

Magic is assembly; how long has it taken to get it running on the
Falcon? Oh, it's _still_ not available? MiNT was, the day the Falcon
came out.

MiNT is faster than plain TOS for most operations. Once the
non-blocking ACSI disk driver is done, it will slaughter TOS on all
fronts.

>
>Notice a large speed loss?!
>
>I'm talking about JUST Mint, the executable and nothing else!

I've done it. My CPU speed went to 97%. Without MiNT, I get 99% on
GEMbench. 2% of my CPU is pretty damned good for all the extras MiNT
gives me (pipes, shared memory, loadable filesystems, network drivers,
shared binaries, etc, etc).

Give it up Steve!

EdHak or Edit-Pro. (Same program, Edit-Pro is the latest version).

Very handy text editor which does pretty much everything, and runs
happily as a desk accessory and has problems with nothing I've been able
to find yet. Will also allow binary file editing.

Where's that manual.... Buried at the bottom of the pile, figures!

Actually it's free - the latest Cubase versions are available via FTP
(Steinberg give their blessing). They are no use to anyone who hasn't got
a key already, as the copy protect is still there.

Try ftp.mcc.ac.uk - this has the latest cubase & cubase-audio versions.

IK>... Since the Atari can't do multitasking, ...

IK>--
IK>/* Cornelius Krasel, Abt. Lohse, Genzentrum, D-82152 Martinsried, Germany *
IK>/* email: krasel@alf.biochem.mpg.de fax: +49 89 8578 3795 *
IK>/* "Science is the game you play with God to find out what His rules are." *

Wrong-o! The Atari ST, TT, and Falcon 030 can all mutlit-task perfectly
well. In fact, running desk accessories (something almost everyone does
almost all the time) is a limited form of mutli-tasking. MiNT/MTOS are
multi-taskers; Mag!x is I believe another; there are several alternative
OSes for the ST series that multi-task quite handily.

Suggestion: Use a little of that science to discover what your machine
CAN do. 250 km is about 2 1/2 hours driving time - go get your
computer, your reference materials, and your software. Stop at one of
the many Atari ST sales outlets in Germany and pick up some of the
Abacus references - you're in Atari heaven over there! - and you may be
amazed and delighted to discover that your vintage-1985 Atari ST can do
what the 1994 MS-DOS users are just now finding possible.

**************************************************************************
IMPORTANT NOTICE!!!!!!! IMPORTANT NOTICE!!!!!! READ THIS!!!!!!!!
--------------------------------------------------------------

As I will lose free Internet access soon (in about a month's time) and will
no longer be able to search and test endlessly all FTP sites any more, like
I have done so far, I will now hand this list over to Mark Smith in the UK,
so that it can be further updated and posted. I might be back on the net
later, and take over again (or do it in co-operation with Mark), but as of
now Mark Smith (msh@dl.ac.uk) will handle everything concerning this list.
So, write to him if you have any updates or new sites etc, and not me.
See ya!

Hallvard, Oslo, Norway

PS. Thanks to all for your encouragement and support!!
Good luck Mark!

PS!!! 155.198.1.40 is more reliable!!! - (uni-paderborn, GERMANY)

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
```

7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

3448. [Q]which modem should I get?

Newsgroup: comp.sys.atari.st
Date: 1994-11-20 20:25:16 UTC
From: hallvart@ifi.uio.no
Message-ID: <3aobbc$fua@baugi.ifi.uio.no>
Source record: 176520

I'm looking for a used modem for use with my Atari STE.
Which ones work well and which ones don't with the Atari's?
I'm looking around in the "modems for sale" newsgroups, but
I have no idea as to what to look for. Thought I'd ask here
first.

Hallvard, Oslo, Norway

3449. Teradesk 1.40 and ST-ZIP

Newsgroup: comp.sys.atari.st
Date: 1994-11-20 20:31:08 UTC
From: Adrian Bridgett <apb25@cam.ac.uk>
Message-ID: <3aobmc$7hb@lyra.csx.cam.ac.uk>
Source record: 176522

Problem: ST-ZIP (and other programs too) don't work with
version 1.40 - but they do work with 1.39.

Teradesk seems to be passing blank parameters to these programs
- they may be blank but the programs get confused.

ST-ZIP for instance tries to open a ZIP file called ".ZIP"
(or "." I think).

>sure.

No Idea what that could be. Anyway, in a few days we'll release Papyrus 3.60
(new: several NVDI3-specific enhancements, more powerful label printing,
easier table cut&paste) and I'll upload a new Demo. Should you still have problems,
mail me your configuration.

I haven't heard about that problem before. Which Speedo 5.0 do you have (a, b or c)?
Do other Speedo-aware programs have similar problems?

In response to sheppard_r@kosmos.wcc.govt.nz's message:

> may be its ok if your are into Midi or Graphics/DTP, but
> very few Falcons and TT have been sold here, there is far too much
> emphasis on Graphics in this mag..

What would you like instead? I'm confused.

> Can some one explain the Overseas price quoted on the cover of 4.5UKP,
> as its being sold hear at $19.75, far over the exchange rate of 2.5
> times the UK pound...

You are being ripped because there is no alternative if you want to read
a mag. Is ST Format the same price over there?

>|> TOS 2.06 by replacing the ROM chips and flipping two jumper wires.
>|>
>|> bye, Peter
>
>Could someone tell me what jumper wires that sould be flipped, please...

They are located close to the ROM chips. They are zero ohm resistors standing
upright, with the wire coming out of the upper end soldered down directly
beside it. On the other side of the resistor, there is a free solder pad.
Remove the wire from its position and solder it to the previously free one.

bye, Peter
```

ANSI does not = VT 100 in any way at all, there are not many Comms program
for the Atari that do VT 100 correctly, Uniterm and Connect would be the best..

FDT does not do VT 100 and is no longer supported, and you need a Key to get it
to run, so far I have never found a comms program that can better Flash 1.6
in all of its features....

So VT 100 is VT 100 and not ANSI...!!!!

From some one that does not know that ANSI does not = VT 100...

The best programs for VT 100 ate Uniterm and Connect, a lot of those programs
listed don't support VT 100 at all, FZDT is one and is no longer supported,
and you need a Key to use all its features..

I am still waiting for a comms program that can better Flash 1.6 in all its
features....

What's with the student hate campaign Roger?

Did a student once do something horrid towards you?

It's either students don't know what they talk about (as I read once today)
or it's only students who use FzDT.

I don't think Atari is going to lower the prices of the Falcon or the TT
because they have no interest in carving a niche in the computer industry
at this point. Everything is Jag-related.

3459. Need ride from NYC to/from Toadfest

Newsgroup: comp.sys.atari.st
Date: 1994-11-20 23:39:42 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <xEzV8X+.johnhechtman@delphi.com>
Source record: 176533

Hey, is anyone from NYC driving down to the Toadfest? I checked and public transportation to Toad seems almost non-existant. I'll split tolls and gas in return for a ride down & back. I'd split driving, but my license expired.

MS> Is anyone here using an atari for packet radio?
MS>
MS> If so, what software /hardware are you using?

Hallo Mike,

shure, we have some ATARI-users in our Anwender Kreis Atari
Freiburg, Germany, using ATARI for packet radio.
I'll look for their adress (e-mail), ask once more next week, ok?

I for myself will use p.r. in future, together with my friends.
Therefore we will build some modems, using the chip:
TCM 3105. . Software will come next days.

My adress: werner_laass@traveller.fido.de

Try turning the widthtables off. This may be the problem. At
one point, it took me five minutes and change to start Atari Works,
but after I turned off the widthtables, I had no problems whatsoever
after that.

>Bill R.
>
First of all, I would recommend getting AHDI 6.061. As for the
bombs, the problem is probably not with your driver, but with
something in the \AUTO\ folder on drive C (presumably the boot
drive). To boot the hard drive, but not run the \AUTO\ folder, hold
down the [Alternate] key after turning the computer on, and let the
system boot up with the desktop. After doing this, click on AHDI.PRG
on your utilities disk, which will activate the hard drive. Create a
C drive partition icon, then click on it. Create a folder called
\AUTOS\, copy the \AUTO\ folder into it, then delete the \AUTO\
folder found in the root of drive C (the one you just copied into
\AUTOS\). (I realize that this seems tedious, but this should work.)
Now, reboot the computer. Do you get the bombs? If yes, leave
me email. If no, create an \AUTO\ folder in drive C. Copy one file
from \AUTOS\AUTO\ into C:\AUTO\, then reboot. Did you get the bombs?
If yes, restart the computer like I said in the beginning, then
delete the file you just copied into C:\AUTO\ and replace it as soon
as possible. If you didn't, copy another file into the \AUTO\ folder
from \AUTOS\AUTO\, and reboot again. Do this until you have emptied
\AUTOS\AUTO, then delete the folders (\AUTOS\AUTO\ and \AUTOS\) (I
don't think you inept, I just want to make perfectly sure that you
don't regret anything.) This should allow you to a) find out which
file, if any, is causing the bombs and b) get the hard drive working.

As an added service, I'll tell you that using a hard drive with
TOS 1.0 or TOS 1.2 is a trial (read v-e-r-y slow!). What I would

recommend that you do is obtain a file called FATCACHE, which fixes this problem, and even caches the hard drive making it much faster (the program only works on TOS 1.0 and 1.2). Oh, and when 'rebuilding' the \AUTO\ folder, start with files like Foldr100 (Foldrxxx), and obvious patches, since if, at the very least, they won't help, they won't do anything nasty.

Hello all,

I am writing because I am looking for software used for creating characters for the game Dungeons and Dragons. I once had a program, but I have since erased it for unknown reasons.

If you know about this kind of program, or others that help with in the game, please contact me. Or, just point to where I can find it, if that's possible.

Joe

It is out. Hasn't got to do anything with 'guts' though. Eric previously forbade any distribution of MiNT binaries after version 0.95 or so. Had someone done despite Eric and Eric had got wind of it, it would have meant the end of free MiNT. So please respect the author's requests.

Well so fare only one reply to this request....

FSEARCH 7.4, where does one file this Program...??

I need a file search util that will find all files say with the string
dog in them, like medog.prg or dogme.prg...

With just entering the name dog and it will search all partitions
or selected partitions, must be fast and not a ACC or TTP....

Is their such a thing, I have used such a thing on a Atari BBS..!!

I think I had this same program, or one very similar, but I got it from
a local BBS. Your best bet would be to look through the more major
FTP sites (mainly micros.hensa.ac.uk ./micros/atari and
atari.archive.umich.edu ./atari/) If they aren't on them, then it
probably isn't on the Internet. I may still have it on a disk, I'll
have a dig around, and if it isn't on either of those sites & I
find it, I'll put it on one/both.

The header:

ix/kosmos = node name
wcc = Wellington City Council (The service providers)
govt = Goverment - The people to whom the Council answer to
nz = New Zealand

Virtually no-one using this address is employed by the City Council
or Government. And certainly not Roger or myself.

Note: All opinions are my own, and have got nothing to do with
sheppard_r. :)

ix.wcc.govt.nz/kosmos.wcc.govt.nz are public access Internet
nodes which can be accessed via dial-in, UUCP, or Telnet. We do however
have substantially less cretins than AOL. This is due at least
partially, to the fact that the interface is less than simple for
the average 12-year old to manage. Personally I think that the Internet
should have an R-14 rating so that real users don't have to put up
with the incoherent semi-illiterate gibberings of those below that
age. (Not aimed at anyone, just a personal opinion after getting
tired of all the stupid messages wasting net-space from cretinous
posters).

Ignore the replyee line, not a word is aimed at him, other than the
description relating to the fact that people using this system aren't
necessarily employed by the council, or Goverment, or for that matter,
employed, period.

Tonnes of software, all crippled because it runs on DOS. Tonnes of
software, most of which is crap.

Sure, a large software library is great (believe it or not, we've got
one for the Atari, with new titles being released every week, even if
they're not all commercial), but for some people, like myself, the
drawbacks far outweigh it.

NEXTSTEP comes with a multimedia encyclopedia. NEXTSTEP doesn't cripple
your machine. NEXTSTEP actually does multitasking, _and_ it's got a
fantastic interface. Oh, and Microsoft doesn't develope for it, one of
the biggest advantages.

gaghon@nevada.edu (GEORGE GAGHON) writes:

>What is happening in the market today is sad. We are losing the
>freedom of selecting a computer that fits our discription of what it
>should look like and run like.

The crunch comes when you NEED a faster machine but there is none
available from the manufacturer you prefer. This is a result of the
computer industry today: the most common brand computers is the
fastest for the price. Apple is fighting back with the PowerPC line.
But Atari could not keep up.

Hence, they lose the enthusiasts with high-demand.

And guess who keeps a model of computer alive? Those high-demand enthusiasts.
Without high-demand enthusiasts doing software development, the userbase
slowly fades away.

I had buy a TT to continue GEM NetHack development. And I gladly paid for
it. But then, when I had an even more demanding project, I had nowhere to
turn. I started using the University's workstations to do more and more of
the work my project demanded. Finally, I had to buy a Linux Pentium to
continue development at home. And I gladly paid for it. If Atari had a
high-end machine, I would have bought that and run 680x0 Linux. But there
is nothing above a Medusa (which is not even made by Atari).

Source record: 176542

I'm trying to compile a list of Canadian and American (overseas is great too, and will be accepted gratefully, but I'm trying to start small, and I need the Canadian names, addresses, and bbs numbers) Atari user groups. I'm not too worried about redundant info, so please make sure the group name, address, and bbs number (if available) is sent to me. I will reupload the list once I have enough groups listed. It's partially so that the user group that I belong to can send out our cool 4 color magazine-like (though not even close to as large) christmas issue to the other groups as well as trade articles, and just generally make more ties with other user groups. Please help me make this list as complete as possible so that, hopefully, we can all benefit from this.

Yes, and they too use huge quantities of disk space. Someone got a figure
for Calamus SL?

>> do anything useful. Take games for instance. They started off saying 286
>> recommended, then 386 and now it's need at least a 486 or Pentium! The
>> games aren't even *that* much better either!

True... because they are just using the CPU power for GLITTER. Sadly,
glitter sells games. DOOM is crap. I've played it full-screen on a
90MHz Pentium with 16bit sound card, so there is no excuse. It's a
puerile shoot-em-up with no mental skills required. The world is full
of puerile, braindead adolescents, so it sells well. What saddens me is
seeing so many netusers drooling over it: this says something about the
changing demographics of USENET.

>> I agree with Timothy, developers use the speed of the processor rather
>> than speed of their code.

That is correct. That has always been the trend. It is more logical to
buy a faster machine than to spend HUMAN resources. That is why I bought
my Pentium: I have better things to do with my life than wait for a
program to compile and to hack ASM code.

>> The only reason why things are any different on Atari's is that most
>> Atari owners have little money to spend on their machines, and so
>> developers have to make the best use of the limited resources available.
>> This makes much better programs.

But fewer programs. Programmer only have so much time. And the smaller
the market audience, the less the get back.

This is quite true. Windows is dog slow even on a 90MHz Pentium with
a sh!t-hot graphics card, because it makes excessive use of the disk.
(yes, even with caching, etc on - DOS just can't do sensible disk
access).

Running Linux on the other hand, you get full power out of such a machine.

Well, the best 1040 to get is a STFM, that is one with the modulator
built-in for television connection. The best would be a 1040 STE moel as
you can upgrade easily to 4 megs, other wise you need to get a Ram Board
at a later time and add Drams for additional memory and these days 2 megs
is a must. It is a cheaper path the later.

Please leave you address to me in e-mail and I will send along Atari ST
related information.

Hope this helps!

Eva Crouse

Here I found it! it was posted in May of this year. Try Tore Nestenius at
dt93tn@pt.hk-r.se

He had two of them for sale at the time.

Good Luck

>some. Why bother? Who cares?

I guess you've never had the fun of getting stuck with, say, a Diamond
video card and an unsupported OS (like OS/2 was a year ago). The
"latest" hardware usually doesn't have drivers for anything but DOS.
Have you tried NEXTSTEP on, well, almost anything strange? Like maybe
one of those new 64-bit ATI cards?

> It's my PLEASURE to choose amongst those operating systems,
>anyway. Just because whatever platform YOU run doesn't allow you the

>likely do not have.

Who the hell wants to run VGA? If I buy a new video card with 4M of
RAM, I want to run _at_least_ 1280x1024 (and not on a crappy 15" SVGA
monitor, either).

The "luxury" is an illusion; you can choose whatever you want from the
hardware if you want to run DOS, but you've got to be VERY careful to
pick stuff that's supported if you want to run OS/2, or Linux, or SCO
UNIX, or FreeBSD, or NEXTSTEP, or Solaris (Solaris probably has the
worst collection of supported hardware of any of these), UNIXWare, etc.

> As for games running 320x200x256 - I find this sufficient. What
>resolution do video games such as the Jaguar or SNES or Genesis display
>on a television set? Apparently it's sufficient for most
>gamers...including this one. Question: What resolution/palette do YOUR
>games run on?

My games run at something like 600x400x16- or 24-bits, AFAIK. Hey,
DOOM's gonna be a mere 160x180, but the 65k colours is going to make it
smooooooooth. Even if your SVGA card can handle it, NONE of your games
do, and there's no guarentee that your video drivers for your OS can
handle it (I know the OS/2 drivers I've got for my ViperVLB can't do
1152x900, and they can't do 16-bit colour, either).

> The confusion surrounding conventional/high/extended/expanded

>understanding computer architecture and upward/backward compatibility
>should have no trouble comprhending such memory, and the HOWS and WHYS of
>how it came to be this way. Obviously, you don't appear to be such a
>person, so forget it.

I understand it, hey, I even know enough to write manuals about it. I
also know how much time programmers (like myself) waste trying to work
around the stupid limitations (all in the name of "backwards
compatibility"). I also know how much time I've spent documenting these
stupid things, and I also know how much time I've wasted trying to
"optimize" my DOS memory, etc. That was until I wised up and started
running OS/2.

> You must be an ST user, since you stated you have an 8Mhz 68000.

Yup, that'd be me. I'm also a user of Macs, various "high-powered" PCs
running several OSs (DOS, Windoze, OS/2, Linux), UNIX systems ranging
from wimpy '486-based systems to Pentium-based systems with a couple
dozen processors and things I've never even seen, strange VAXen, etc,
etc. It's my _job_ to know as much about every computer I can.

>I suppose the Atari TT with its "ST RAM" and "TT RAM" flies in your face
>after you state that "Memory is memory on any system that isn't running
>DOS." Gee - does the TT run DOS?????

The ST-RAM/TT-RAM stupidity is in the name of backwards compatibility,
too. If you're a "power user" like myself and you've got a TT, you've
probably got 2M of ST RAM, which only gets used for video (unless you've
got a video card) and some disk DMA transfers, and a tonne of TT RAM
which you use for all your programs.

Besides, the ST-RAM/TT-RAM division doesn't affect the user _at_all_,
unlike DOS users, who are constantly fighting their device drivers to
somehow pull a few more bytes out of that 640k that they can use. This
is absurd on 4M machines (probably the most common '386/'486 memory size
around) and totally laughable on 8M or 16M (or more) machines.

>> It's a pity DOS is so minimalist; all DOS applications basically
>> re-write DOS and use the BIOS directly for speed.
>
> You've gone off in a highly philosophical direction
>here....minimalist! Would you care to elaborate on that? How about some
>hardcore examples, please!!!!!

Every DOS program (ex, WordPerfect, Word, Harvard Graphics, FrameWork
III, etc, etc, every single game, etc, etc... just list some of that
huge library of apps you were talking about) goes straight to the
hardware, usually for "speed" reasons (ie, DOS and the BIOS are too
slow), sometimes because DOS doesn't provide the services. Does DOS
have networking? Does DOS have printer drivers for *anything*at*all*?
Nope, all the programs have to provide that. Does DOS manage memory?
Nope, you gotta load HIMEM.SYS and EMM386 (or '386MAX or QEMM). Does

DOS provide access to the hardware? Nope, half the time you've got to load drivers. Does DOS provide some sort of screen-handling? Nope, you gotta load ANSI.SYS. Does DOS give you a decent command-line? Nope, you gotta add doskey or Norton's Commander or something.

About all DOS gives you is basic hard drive and floppy handling, basic keyboard input and text output. Nothing else. Minimalist.

> What if your new automobile or digital alarm clock didn't include
>instructions? What if your underwater basket-weaving kit didn't include
>instructions? What if your Chia pet didn't include instructions? What
>is your point? If I don't get instructions for ANYTHING I don't buy it.
>Does this problem have some specific relevance to computers, or DOS?

To PCs. Do you have documentation for your motherboard, SVGA card, IO card, mouse, keyboard, IDE drives (I'm assuming you've got IDE drives), etc? No? I'm not surprised. I sure hope you don't have to add a new card any time soon, it'll be fun, fun, fun trying to pick an unused IRQ and memory address. Have you gotten the impression that I do a bit of PC support as part of my paying job yet?

> HAH!!! VME port indeed. How about a list of video cards and
>manufacturers who peddle VME cards. I'd like to supply you with a list

Hmm, strange, they're those same ET-4000-based cards you can plug into your PC...

>of PC video cards and manufacturers, but I haven't the time and the net
>hasn't the bandwidth. An easier solution would be to look in the Product
>Index of ANY issue of Computer Shopper and sit down with a six-pack.

Hmm, strange, not all of 'em have drivers for NEXTSTEP. Hmm, strange, Linux doesn't support the Diamond ViperVLB card I've got in my system at work. Oops, guess it's my fault, and I'm outta luck.

>IRQs take some getting used to, but anyone who can't figure them out and
>resorts to calling them "stupid" must be a vacuous imbecile himself. I'd
>have much less difficulty setting an IRQ and installing a SCSI ISA card
>than obtaining an Atari DMA-->SCSI host adapter.

Hmm, let's compare:

Buy Atari DMA->SCSI host adapter:
1) call Toad computers (wow, a 1-800 number for Atari stuff!)
2) say "I want an ICD Link."
3) say VISA/MonsterCard number and expiry.
4) Wait.
5) Plug it in.

Buy an ISA SCSI card:
1) call Fly-By-Nite PC Hardware
2) say "I want an ISA SCSI card."
3) say "no, I don't want that crappy one, I want an Adaptec" or whatever
4) say VISA/Monstercard number and expiry.

5) Wait.
6) discover they sent you the wrong one, send it back. Goto 1.
7) discover that it's DOA because FNB doesn't know about static
discharge. Goto 1.
8) Plug it in.
9) *Guess* which IRQ isn't being used alreay on your system. This is
excruciatingly painful on a system with a sound card, a network card,
a CD-ROM with its own stupid interface card, etc, etc.
10) *Guess* which I/O base address isn't being used.
11) *Guess* which memory address isn't being used.

It's not as easy, don't try to tell us it is. You can't hope to
convince me, I've _done_ both, I do support for PCs as part of my
real-life job.

> PCs have evolved from an old architecture - who doesn't know
>that? The inherent drawbacks and limitations of modern PCs are simply
>the price that has been paid for 15 years of upward compatibility. This
>"price" has, however, been more than compensated by the world's largest
>software arena. Anyone who cannot comprehend that fact and resorts to
>words such as "stupid" to describe the PC has no business evaluating PC
>architecture.

Backwards compatibility isn't the end-all of reasons to buy a computer.
I, for example, have _no_ library of old PC software that I need to run!
Incredible, isn't it? All that backwards compatibility does is buy me a
crippled system. Yahoo, glad I spent all that money.

> I'm sure most reasonable people will concede that PCs had their
>own merits at the time of introduction, which is why they commanded such
>a high price back then. I'm sure a "dumb" terminal would have been a
>more cost-effective solution if the objective was merely to connect to a
>Unix system.

True. Back then, PCs were something interesting. So was the C-64.

>> Cancer can spread rapidly, too. Then the host dies.
>
> Is there supposed to be some profound analogy here?

Yup. Try to figure out how much _more_ work you'd get done if you
didn't have to futz around trying to squeeze a few precious bytes out of
"conventional" memory. If you've never tried to put a DOS system on a
network you haven't the slightest idea how evil the architecture is.

A guy at work, VERY knowledgable with PCs (hell, he's been programming
them since DOS 2.x) just bought a new '486 with all the bells and
whistles. Against my strong suggestion, he foolishly buys a system with
IDE drives. Ok, so there's IRQs, I/O bases and memory areas being used
by his motherboard, his video card (at least he got localbus video), his
IDE hard- and floppy-drive interface, and his I/O card (he also
foolishly has a serial mouse).

So he adds a cheap CD-ROM drive with it's own interface card. Not much of a problem, only took a few hours to find an unused set of IRQ/IObase/memory to put the card in. I would've selected a SCSI ID and plugged it in.

A few weeks later, he gets sick of the fact that PCs are *still* the only computers on the market that don't come with sound as standard. So he goes and buys a sound card. Uh-oh, it takes him TWO MONTHS of fooling around to find another IRQ/IObase/memory area that isn't being used, since sometimes it'd work, and sometimes it wouldn't (obviously, depending on which other hardware he was interfering with, and whether he was using it, too).

THEN he goes and buys a tape-backup system, again with it's own interface card. Gee, things are getting a bit crowded, and there's about *one* IRQ left. Gee, this would've been easier if he'd gotten full documentation about how his system was set up when he got it... not much fun trying to call motherboard manufacturers to try and decipher their DIP settings and their BIOS settings.

Finally, after many, many evenings of messing around, he gets it all working under DOS. Then he boots OS/2. Uh-oh, his soundcard suddenly stops working again, and uh-oh, his tape backup doesn't have drivers for OS/2. Tough luck isn't it. Must be his fault.

If you ask me, it _is_ his fault for falling into the PC mentality... if he'd spent about $200 more for a SCSI card and SCSI disk, he could've plugged his CD-ROM and his tape drive into it, with no hassles at all.

PC users never care about how much time they waste messing around (and I hear about it *all*day* at work, since almost everyone there has a PC at home). All they care about is their huge (DOS) library of available apps (99% of which they'll never use, never buy, never see, and never have a use for) and the fact that they can get a <long string of basically meaningless numbers> for <low price>.

If I'm going to spend my hard-earned cash on a new computer, it's GOT to be as much of a switch as it was when I bought my ST, moving up from a C-64. I'd be moving _down_ in terms of hardware and OS design if I went to a DOS PC. Sure it'd be much faster, but it'd just be sucking fast.

"Modern" Macs aren't any better (the "memory management" MacOS provides is ridiculous).

There was a time, in the early 80s, when the person computer arena was _interesting_. Now, it's basically Macs and PCs, and they haven't changed since the early 80s. It stinks.

There are no IDE streamers at all (yet). The cheap DOS streamers
are slow and are connected to either the floppy port or the centronics
port.

(1) Just because there's a type definition doesn't mean that one of the
companies is going to add that code.
(2) Programmers don't have to program for a special vector font type --
all these font types are handled the same way by application programs.

>ends, but I dunno if the wiring is pin 1 to another end pin 1 etc.etc..

You're correct its a six conductor cable with telephone type
connectors at each end. Holding the two ends together with the little
levers on the back side down, they both are configured, reading from
left to right, black, red, brown, green, white, gray. Some of the
colors are difficult to see thru the almost clear plastic but they both
read from left to right and I verified the sequence with an ohm meter.

Not sure if any telephone cables will work but a replacement cable
can probably be gotten from;

3492. MiNT

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 08:21:00 UTC
From: Ian_Taylor@a2w.maus.sub.org
Message-ID: <199411211021.a28611@a2w.maus.de>
Source record: 176451

My local node now has a copy of MiNT is Not TOS: Version 1.12

As I only have a 1MB STf 1040, can I do anything useful with this?

If you want to reply personally, please check you are using the
address below, there may be a fault in the gateway addressing.

Ian_Taylor@a2w.maus.de Hmm, maybe time I had a new signature?

3493. MAGIC/EASE?

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 08:55:25 UTC
From: ralunsfo@uncc.edu
Message-ID: <3apn9t$q8m@news.uncc.edu>
Source record: 176454

I'm interested in more information on Magic and Ease. I have a Falcon, and am considering many options right now (OS-wise). A few questions, which I *think* I know the answers to, but am not positive..

1. Completely MiNT compatible?
2. Falcon compatible?
3. compatible with TOS/GEM apps?
4. in English?
5. projected price range/release date?

Any other details, tips, and misc info would be *greatly* appreciated,

Russ

ASTRAsoft (that's us that is) will also be there, certainly at the Birmingham
show and possibly the London one (depends how we feel on the Saturday night!)
on the Goodmans stand. Mike will be selling disks of the most up-to-date
PD and shareware available on the Atari.

We'll be showing off STORMTRACKER, our music editor which has received very
good reviews in the mags.

Hope to see you there!

David

> multi-taskers; Mag!x is I believe another;

Correct. Nevertheless, to use an Atari as an interface for a laser printer,
I wouldn't want to buy another OS first. ACCs have limited multitasking
capabilities, but for what I suggested (running Ghostscript in parallel
with another application which serves the printer and DMA ports) ACCs
are not sufficient (unless you would program this application as an
accessory, something I wouldn't want to do).

> Stop at one of
> the many Atari ST sales outlets in Germany

Unfortunately Germany isn't any more what it used to be in respect to
Atari. Most vendors have dropped Atari support completely.

The reason I switched computers was that I couldn't get an Atari with
the performance I need for a decent price. Now I'm owning a 486/66
running Linux.

Good news IMO, let someone keen market the products! I think the
production lines work 'on demand', so if someone wants to buy 1000
TTs, they'll be made.

Try using a ANSI comms program on a VAX machine, no it does not work,
you do need real VT 100..

The machine that I connect to is a VAX running VMS, and a lot of comms programs
just don't work even when they state VT 100....

68000 - they work on my ST, If you've got a Falcon you could probably get it
slightly faster still by compiling for '020.

No, AHDI runs before it checks the auto folder and way before it gets to the
accs. The problem could be due to a bootsector on a floppy disc, or possibly a
corrupted copy of AHDI - try reinstalling it.

>I would appreciate any comments people have in these two programs.

That's write has IMO a worse user interface - but not everyone would agree with me, and Papyrus's does get in the way a bit on smaller screens (I'm used to 1024x768).

That's write can use printer's built in fonts as well as fonts sent as bitmaps from the computer in the same document (Calligrapher could use built in fonts in a special draft mode, but not mixed with graphic ones) which can be useful as it prints faster. The cost you pay for this is that the normal speedo scaler can't be used and it has it's own one built in instead - which is slower than that in NVDI and doesn't currently support TT or PS fonts.

It has a few other nice features like being able to specify for each style what the default style for the next paragraph will be, so after a heading it reverts to body text, but the styles still have two letter names!

In general I would say Papyrus is much nicer, TW perhaps more powerful and slightly faster.

>- they may be blank but the programs get confused.

>ST-ZIP for instance tries to open a ZIP file called ".ZIP"
>(or "." I think).

It may be passing a space, or have the length byte wrong, which the startup code for ST-ZIP interprets as a blank argument; or possibly it's trying to use ARGV but either does it wrong or ST-ZIP reads it wrongly. These are just guesses though.

What other programs suffer from this? Does it depend on what compiler they are compiled with - if so it's probably a problem with the startup code supplied with that compiler.

3517. SM124 problem :(

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 11:53:00 UTC
From: Ian_Taylor@a2w.maus.sub.org
Message-ID: <199411211353.a28645@a2w.maus.de>
Source record: 176479

When I turn on my SM124 the raster goes black on white for some
seconds, clearing slowly from the bootom of the screen, leaving thin
vertical black lines for a few more seconds before it finally looks ok.

I'm pretty sure this ain't right <grin>.

Anyone know this problem?

If replying direct please be sure to use this address:

Ian_Taylor@a2w.maus.de

3518. Re: MAGIC/EASE?

>am considering many options right now (OS-wise). A few questions, which I
>*think* I know the answers to, but am not positive..

>1. Completely MiNT compatible?

It doesn't run with MiNT installed, and it doesn't provide most of the new features of MiNT, although new versions apparently will (whether they will in a way compatible with MiNT I don't know)

>2. Falcon compatible?

Not the current version. Magic replaces the whole of the roms, not just gemdos and the aes; therefore the falcon version was not originally released as a lot of extra work was needed on the extra xbios calls. I think they decided not to bother with a Falcon release of version 2.0 and to release Falcon and ST versions of version 3.0 simultaneously.

>3. compatible with TOS/GEM apps?

It runs tos apps in a window which is nice but depends on them not doing nasty things like direct screen writes. GEM apps and text based TOS apps should run well as with MultiTOS, but non-gem graphical programs will not run so well.

>4. in English?

Yes

>5. projected price range/release date?

version 2.0 has been out for ages, I think 3.0 is scheduled for release this year some time.

3519. HELP Captain Blood

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 12:15:51 UTC
From: lonsdale@acri.fr
Message-ID: <1994Nov21.121551.17332@acri.fr>
Source record: 176490

Can anyone help me with Captain Blood. I've had the game
for about 5 years now and I resurrected it having forgotten
how infuriating it is. I can talk to the aliens for a while.
Sometimes I get a co-ordinate out of them. I may even
kill off a whole race, but I eventually always get to
someone who spouts a whole load of numbers and asks for
a code.

Can anyone give me any clues as to what I am supposed to be
doing. The manual I have got is very short and not too helpful.
I am looking for the numbers (clones). But I wouldn't recognise
one if I saw one.

HELPPPP.

Andrew

IMHO, this is one of the most important reasons, if not the most
important of all, why Atari got into so much trouble later on.
The time between 1985 and 1989 was essentially lost, at least
in terms of system software. In 1985, TOS was superior to *any*
OS on the PC, and it wasn't too far away from the MacOS. It had
an elegant UI for the time, it was quite fast (at least when you
compare it to Windows on a small PC), and it was a lean'n'mean
OS which everybody could understand and configure. A real beauty,
I'd say.

I never quite understood what was going on at Atari during those
four years. Maybe one day an ex-insider speaks up and enlightens
us, but personally I believe that they were simply overwhelmed
by the ST's initial success. They didn't manage the growth
properly. They should have turned the incoming bucks into R&D
money immediately, but not for out-of-focus projects such as
the Abaq, the various CD-ROM attempts, the STE, and whatnot.

> And despite this length of time, there were still bugs (although not
> as severe) and a smal but significant number of programs were
> incompatible.

One official reason for all the delays actually was that Atari
tried to avoid incompabilities, but I never bought that story.

Source record: 176491

Tommy Jonaeson (jonaeson@algonet.se) wrote:
: 2: Better graphics in obsession, (more cols), better than starball.
: (Better graphics consumes more memory, thus smaller board)

I'm a graphic artist and to be honest the graphics in Starball are of a very high quality. There is hell of a lot more animation in them for a start and they consist of more than static pictures which is all obsession is, a few static screens, two flippers and a ball, oh and don't forget the 1 bitplane score at the bottom.

: 3: Better drawn?!? Are you colourblind????

The Starball graphics have a very gigery appeal to them, they suit the gameplay very well. Therefore they are good graphics.

: 4: "more going on" are you on drugs? Compare the graphics quality!!!

Yes lets compare them: Obsession, a few pictures scrolled up and down. Starball - the background, the aliens, the animation, the rotating ball, the intro screens, etc...

: 5: You're correct, but do you want a shot-em'-up or a pinball game?

The idea with Starball is you get both. Obsession is pure pinball, no doubting that.

: 6: How do you rate games? You're like that lamer in a magazine I
: recently read, who rated modems by the number of diods on the front!

Games are rated on how much you enjoy playing them and I for one enjoy playing Starball a lot - I think that's why ST Format and ST Review rated it so highly, don't you think? Or are they lamers too?

: Regards, Tommy

From: mu@pax.eunet.ch
Message-ID: <CzMBJ8.6Bw@eunet.ch>
Source record: 176497

As I have already had three times the power supply broken on different ST's which costs about 100.- to 150.- SFr. I am asking myself, if there is a possibility to fix this part myself.

My questions are now (manufacturer of the boards is Mitsumi):
- Are there any parts which are known to break?
- There are some Hitachi-parts on the board which I can't buy here. Are there any known replacements for these?

Thanks for any help.

Kurt

50Hz. (Yes, the same as an RGB monitor!) This is so they don't have to time the demo again for a 70Hz display. You can tell these demo crews are used to the 50Hz displays on the ST(E)s.

(Oh btw, if you want a superb demo, then there's a new one on one of the German FTP sites called "Xperience" which is really quite impressive!)

>Obsession is most certainly RGB only, it fails quite miserably on my VGA
>but it may work fine on the more advanced SVGA monitors.

I doubt that- Obsession is primarily an STE game, with some alterations to make it Falcon compatible, so I expect it'll be programmed around a 50Hz RGB display.

>Also never run
>NVDI or Warp before running demos, they will often not accomodate this.

Yes, a lot of demo coders are still thinking in terms of the old ST demos, where they could hog all the memory. You can only really do that if you're booting the demo stright from the disk. Talking of which, how come there's been no disk-loading demos on the Falcon? OK, it might be quicker to load from an HD, but the time taken to copy demos from a disk to a drive and de-arc them is most certainly not quicker!

Michael.

It has to speed up the bus, not just the processor. The only other card I know of that does this also comes with resolution enhancement software. As for using blowup with it, I think blowup stops you from using high dot clocks on 16bit because of the bus speed, if you hacked it to get rid of this then it probably would work.

NO NO NO NO NO NO NO NO, in otherwords, NO.

It took me ages to download, fortunatly I did it at Uni, but it was still a waste of time.

If they've already got NeXT systems in there, it would make much more sense to buy PCs (or HP 9000 700-series workstations) and run NEXTSTEP on them; they've already built up their NEXTSTEP administration experience, and it'll drop right onto the new hardware. They should be able to "upgrade" (usually for free, or little cost) to newer "fat" binaries that'll run on the older 680x0-based NeXT systems and the Intel-based NEXTSTEP systems.

Canon's object.station 41 is probably the only Intel-based PC I'd ever consder buying. It's designed specifically to run NEXTSTEP (hey, guess what's loaded on the disk when you buy it? NOT yet another copy of DOS/Windoze!) and wipes the floor with most of the Pentium systems out there, despite the fact that it's only got a '486dx"4"/100 CPU in it. The graphics and disk subsystems kick the ass of most of the crap they put into those "loaded" Pentium systems (IDE disks on a Pentium?!? give me a break!).

NEXTSTEP is still the only interesting GUI available; it's as much of a step-up from GEM as GEM was from GEOS on a C-64 and it'll even use your hardware the way it was designed to be used, instead of as a fast 8088...

Get the impression that I like NEXTSTEP yet? :-) Anyone else remember those happy rumours of Atari talking to NeXT around the time the Falcon was released?

You seem to have totally missed the point in your vacuous flaming. The
hardware on those video cards may be great, but the *software*
generally doesn't take advantage of it.

I'm sure your video card can handle 16-bit or 24-bit colour at some
resolution... do you have _any_ games that can use that mode? Didn't
think so.

I know several PC-owning people who have considered Falcons because they
want to do DSP work. It's usually just cheaper for them to pick up a
better DSP-equipped soundcard though (but then they try to get
programming information for them...).

It's a pity Atari's kept the Falcon and TT prices so high... who do they
think they are, Apple? IBM? DEC?

MS sells DOS and Windows because:

1) people don't know any better
2) momentum
3) it's "free" with their new PC

If the people who buy 95% of home computers knew *anything*at*all* about
computers, they certainly wouldn't be picking up a copy of DOS with
their shiny new 32-bit computer systems. If they had lots of DOS crap
that they needed to run (ie, they'd pirated DOS WordPerfect and Lotus
from work), they could choose OS/2 and still not have to worry about
"extended", "expanded" or "conventional" memory... it's all just a
couple of clicks away for OS/2, no fiddle with config.sys/autoexec.bat
and reboot...

As far as I know there is not a WP for the ST available at the moment.

The latest (working) version for the PC is v6.00 - an apparently all singing

and all dancing one. The last one I used, before getting my Atari, was v5.02

Hope that is a help - the people to contact would be Microsoft or one of

their dealers!!

Buy a copy of the PC World magazine or similar - and you will find the

contact point you require.

Yours

Adrian

3549. 2nd CFV: comp.sys.atari.programmer

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 16:11:43 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.programmer-CFV2@uunet.uu.net>
Source record: 176372
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

LAST CALL FOR VOTES (of 2)
unmoderated group comp.sys.atari.programmer

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

Votes must be received by 23:59:59 UTC, 28 November 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing lists lexicor-list, gem-list mailing list, gem-magazine.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

HOW TO VOTE

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.programmer
I vote NO on comp.sys.atari.programmer

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and votes of all voters will be published in the final voting results list.

>Should Have Been" by Byte (I think). I can't remember the product name though.
>Anyway, it was far smaller, far faster, far nicer to use, and, had all of the
>same features plus some. Problem was, the company had no money for advertising

Yes, I know exactly the product you are refering too, did everything Windows
did, but better, and on a 640K machine. Sound impossible? Look at the
operating and system requirements of any Atari program (ie. Papyrus)
and compare it to the equivalent MS-DOS/Windows program (ie.WordPerfect) mondo
kludge?

>(sound familiar?) and thus the product did not sell well. If the
'system' for >shopping was a bit different; if more people checked out all
options instead of>just shelling out $$$ for whatever has the most name
recoginition, then maybe a>lot better products would be the 'standards' today.

Windows is a marketing success story, not a programming success story.
Bill Gates rode IBM coattails to fame and fortune, then abandoned IBM to push
a DOSshell called Windows

>Maybe it is a bit like the
>American car thing. I was one of the people who refused to believe that
>American cards had become crap, and that the Japaneese had far superior
>quality. Of course, as it turns out, around 1972 American cars did begin a fast
>downward spiral that they are (I hope) just now pulling out of. Despite all

: In article <3a1rs9$sce@aristotle.algonet.se> jonaeson@algonet.se (Tommy Jonaeson) writes:
: >It took me 3 days to learn MS-DOS/Windows and the hardware good enough to

: If you use an ATARI, I don't see why it takes you 3 days to learn how to use
: Windows. Most stuff are similar, click and drag etc. Infact, the program
: groups are great idea, having stuff that do the same thing together, otherwise
: the new Neodesk would not have followed them, right?

: I think the transition to use Windows is less than 2 hours as GEM really
: prepares you for it. It did for me, for that matter I can use X-windows
: without any help the first time.

I fail to see the argument about "Gem is better than windows" the reality
is the opposite. MS-WINDOWS may be buggy and slow at times but it offers
iconify, looks pleasant and is realtively easy to use, plus is is
standard across ALL pieces of software. For example take MS-ACCESS it
is very easy AND powerful to use. It combines an easy to use GUI with
the OPTION to move into marcos and database programming if you wish.
I have yet to see a powerful relation database for the Atari.

To be honest I would say both are pretty much equal. However I have
to say that the atari way of NOT making the GUI the operating system
is still MILES ahead of MS-WINDOWS. For example you can add in
fast, reliable pre-emptive mutlitasking and change the front end
very easily.

: Installation of DOS and windows is a breeze. They have auto install program
: that will do it for you in less than an hour. In fact most software that I
: have installed can be done in less than an hour.

On the Falcon (which I have) mosty software takes less than 5 minutes
to get up and running. Also it doesnt take up MEGS of disk space.

Have any of you windows users ever used Geoworks Ensemble? Well
try this and you will see how bad Windows really is. Ensemble offers
fast pre-emptive multitasking, Motif GUI and an excellent range of
BUILT IN APPS, whats more they are fast even on a stock IBM 286 machine.

3554. Spectre GCR & ST Replay Digitizer FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 16:57:16 UTC
From: troyc@bnr.ca
Message-ID: <3aqjhc$16j@bmerha64.bnr.ca>
Source record: 176376

I have the following item for sale. I have not used them for quite some
time, so they are just sitting around collecting dust:

1. Spectre GCR 3.0
All original software included
All Mac disks I have
PRICE: $200, shipping included

2. ST Replay 8 Sound Digitizer
All original software included
PRICE: $40, you pay shipping

3. PC Ditto II
All original software & hardware
I got this to work once, but then I switched to a Mega STE so I
cannot use this board. I cannot guarentee it works.
PRICE: Best offer, you pay shipping

From: dw@dcs.ed.ac.uk
Message-ID: <CzMrA1.GBH@dcs.ed.ac.uk>
Source record: 176429

I've downloaded a lot of files recently some for the atari st and others for the UNIX system at university but a lot of the files are compressed using a method called tar. Is there anybody who can tell me how to uncompress .tar files on a UNIX system or an atari ST (either will do) and what programs I may need.

Also other atari files I've downloaded that are compressed with .zip have the last file corrupted is this the files or the download that have gone wrong?

Thanks.

3565. Xperience demo

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 19:25:33 UTC
From: krlawson@xgw2.xgw.fi
Message-ID: <3aqs7d$cni@t3.xgw.fi>
Source record: 176386

The xperience demo for the Falcon doesn't work on a TV because the demo's routines only check for a VGA and RGB monitor. Is there a path for this? If so where can I get it from?

btw. I did get it to partly run by loading the Warum demo first and then loading Xperience. The TV then gave a split screen which sometimes had colours and sometimes not.

3566. Hi Soft!!!

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 19:26:16 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3aqs8o$gkt@dux.dundee.ac.uk>
Source record: 176379
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

If your a student and looking for a bargain, then get down to Hi Soft.
They offer a whopping 30% student discount. This meant I got Speedo
and Papyrus for LESS then the normal price of Papyrus on its own.
Total Cost: Speedo + Papyrus #112 ukp.

Having said that I wont be eating for 6 weeks to pay for it, but
who cares, I no longer have to suffer 1st Word Plus and its dread-
ed hyphens. At last different page sizes, graphics and DTPish
type facilities. Also at last I'll be able to get a bit more
USE out of my rather pricy Falcon.

I'd encourage ANYONE who this offer is open to to give it a bash,
Hi Soft offer a really good range of Atari Stuff. So if we want NEW
software for the Atari we can atleast buy it off them and give them
some encouragement top make new stuff. Whats more we save a few bob
at the same time.

Also if your keen to try before you buy Papyrus has a Demo, which I
believe can be FTP's from some places and is also available FREE from
Hi Soft.

3570. comms software questions

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 19:48:22 UTC
From: hallvart@ifi.uio.no
Message-ID: <3aqti6$219@holmenkollen.ifi.uio.no>
Source record: 176431

I'm soon going to lose my UNIX account here at the university and
I'm trying to find out how to connect comercially.

Unlike now, when I can sit for hours reading through newsgroups/mail
for free, I will have to use a modem and pay for the time passing by,
that's why I need an offline reader.

I know there are several available for the ST, but I don't know which one
would be the best suited.

The company supplying Internet will give me access to a UNIX machine
and they support these formats as offline: QWK, SOUP, ZipNews and
PopMail (Eudora).

I've heard from others on the net that QWK isn't that good a standard
for Internet, so what about the others? Which program would be best
suited for my STe to connect to the UNIX host machine for offline
reading?
Thanks.

Hallvard, Oslo, Norway (hallvart@ifi.uio.no)

Pinball Dreams has been converted by an old friend of mine 'Stewart Gilray',
it is being distributed by 16/32 PDL - it is an exact conversion of the amiga
version, which makes it about 10 times better than Obsession in my opinion.
Pinball Fantasies will also appear on the falcon at some point. You might even
see wolfenstein soon ... (hint hint).

Well, I used to use Tom Hudson's CAD3D when I had an ST, but it dies the death on the Falcon.

A shame really, as I just tracked down a CAD3D to POVraytrace converter which could have provided me with quite a good budget system.....

Ce'la vie - I don't do much 3d work anymore anyway so I won't be buying a proper Falcon system (Inshape, Phoenix, Xenomorph, et al).

AutoDesk Animator was supposed to get released but never appeared.

Craig.

>- and you can't accidentally erase the ROMs.
>

Hi Rich.. Sorry for butt in here.. But i have a question for you about you opinion above.. You say, why not buy... Well, if he chose to buy, who will have benefits of the money then.. I'll answer, it's not atari since they have already said they didn't care.. I'll tell you what is going on. The dealer copy the ROM's for sale as well, and if you find the guy above quilty of copy'ing the ROM, then you'll have to find the dealers quilty as well.

I have not seen any statement from Atari on paper about giving up TOS 2.06 but a company in Denmark got the right to do whatever they wanted with it as long as Atari Co. was kept out of responsebilities. As Atari said to them, we don't care what you do. Now this company copy and sell TOS 2.06, and they have never had any "legal" copy of it. It was a originally a copy of the German Tos 2.06, which they translated to danish.

Does this give them the right to copy and sell it, then a user can use exactly the same right.

3576. "Monster"- where?

Newsgroup: comp.sys.atari.st
Date: 1994-11-21 20:49:11 UTC
From: hallvart@ifi.uio.no
Message-ID: <3ar147$3lb@holmenkollen.ifi.uio.no>
Source record: 176387

Where can I find the big-screen emulator "MonSTer"?
I already downloaded it from aaue, but it didn't work-
the file was corrupt, and I can't find it elsewhere.
Anybody?

Hallvard, Oslo, Norway

Well aaue is mirrored at ftp:/src.doc.ic.ac.uk/packages/atari. It also has "stretch" which
allows you
to specify the size explicitly.
```

Hi !

I've heard about the new unreleased PC software emulator
called SoftPC. He's available on some Atari BBS's
(which ones - i don't know).
Can anybody download him from BBS and put it
on some ftp site ?

Thanx

Not quite.

After a while, Bloods vitality starts running low, and his hand (the mouse pointer basically) gets more & more difficult to control.

Copied versions do this all the time, e.g. as soon as it loads up, it's impossible to control.

Even with the complete solution I still couldn't finish this game....

Message-ID: <3ar9s0$814@netline-fddi.jpl.nasa.gov>
Source record: 176396

I have Supra utilities version 4.00.

My 81 MB ESDI drive is connected by way of an Emulex MD-21.

Until recently I had two smaller MFM drives connected by way of Adaptec ACB-4000A.

The MFM drives would autoboot. The ESDI drive won't.

I've run SUPUTL, and it says it enabled autoboot. (I was careful to run it after booting from a floppy with only an AUTO folder with SUPBOOT.PRG in it. Nothing in the root. Especially no cache anywhere.)

I ran SUPEDIT, and of the partition tables, it says partition C: is a GEM partition with boot enabled, and D-G are GEM partitions with boot disabled.

The C: Boot sector has checksum = 0x1234.

I ran SUPFIND. It found SUPBOOT.PRG is version 3.11 in memory, on the floppy, and on the C: partition.

Send any ideas via e-mail.

I'm not going for a laser or color printer. Probably a 24 dot matrix
or an ink jet printer.
I will spend about $400 canadian.

I would like to be able to use the printer for business receipts as well
as printing out yer basic document.

I copied out the printer configurations available in my Wordwriter Program,
but am nervous about picking up a printer that doesn't match these
configurations exactly. (company and item #)

What's the important thing to remember to make sure the printer will be
atari compatible? I don't expect the sales people in some of the Toronto
computer stores to know the difference.

Thanks.

I see this as problem as well. When I moved from my ZX Spectrum - the ST or Amiga were obvious choices. Now the ST is in decline - there is nothing obvious to upgrade to. The MSTE, TT and Falcon are all stopgap solutions (of different sorts). There is no obvious new machine to buy - unless you count the PowerMacs. Its a pity that these will be blown out of the water when IBM and Aplle *really* get their act together in 2 or so years time.

What about the PC? Well its another stopgap solution - running on inertia. True I ordered one today to *suppliment* my TT, but it not a solution in the way my original 1986 STM was.

The price is definately not *right*. OTOH I don't think things are as bad
as you think.

Fisrtly the graphics card is not *really* necesaary. TT-Hi is plently good
enough for most serious use - and TT-Med is pretty respectible if not very
impressive.

Secondly TT can be very good second had bargins. I paid the price of a
486 clone for mine - but they can be had much cheaper if you are not
too fussy about the spec.

Whether its actually worth buying a TT at this late stage in its life is
debatable - but that doesn't detract from the point that its still a very
nice machine.

:-)

Roland.

Why? I don't think so. It _is_ true that we don't have direct equivalents to 486- or Pentium PCs made by Atari. But these comparisons disturb me, since the OS isn't the same, either. Falcon under Windows would be pretty awful, I guess. Just like those 386..486SX PCs. But TOS isn't Windows - fortunately. Falcon works quite happily even unaccelerated. With some Afterburner accelerator card (68040/66 MHz) it probably behaves like a dream.

Falcon _is_ reality. We can buy it - and it is a good computer, no matter what some people think about it. TT is reality, too. Accelerated to 48 MHz and equipped with a good graphics card, like new Spectrum cards (up to 6 Mb VRAM and huge resolutions, accelerated ;-), that machine is worth its price.

And then there are Medusa T-40, T-60 (68060 !!!), and Eagle Atari clones available. So, can we really say there's "no hope" ? I really don't think so. Our problem, however, seems to be this: we look at those PC technical specs (forgetting that Windoze _requires_ much more horsepower than TOS!), and feel that Atari is unusable old-fashioned, slow and so on. What matters is that the machine _works_. Atari compatible computers do work today. There are lots of fine programs available, and with OSs like Geneva, MiNT and MagiC (not forgetting Dextrous ;-), the future doesn't look bad either.

> The crunch comes when you NEED a faster machine but there is none

> is nothing above a Medusa (which is not even made by Atari).

Why should it be made by Atari? Are all the PCs made by IBM today? And can you
really say that Medusa T-60 with 68060 processor (yes, it _is_ reality!)
isn't fast enough for you ?? Somehow I doubt that ;-) Especially, after
I saw Calamus running on both Medusa T-40 (68040) and on a 486-66 PC (under
Windows NT). Guess, which one worked _much_ faster..?

This is getting serious, if the PC world has really brain-washed us to measure
Atari computers on PC scale, don't you agree? If this goes on, soon we'll all
want a 786-PC because of its "raw power" - even though its OS and software
don't necessarily run any faster than Atari TT.

Disagree, if you want to - but somehow I feel that _we_ Atari owners lack
self-confidence. We don't have guts to be satisfied - we only complain...
:-(

By the way; when will the next (hopefully 68030-optimized ;-) NetHack be out ?
I really can't wait for that -

Don't surrender - fight back. Because otherwise all we'll have tomorrow will
be Windoze-PCs. And, I think, most of us bought an Atari because we really
did NOT want to buy a PC. That's something to think about, no matter what
kinds of 786-processors they develop. If we buy Atari-compatible machines like
Medusa, we support Atari computing. Even if Atari itself didn't care...
The PC world don't need IBM either, does it?

3592. Disk Drive for ST wanted...PLEASE!

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 01:22:39 UTC
From: trudeau@titan.ucs.umass.edu
Message-ID: <3arh4v$oo7@nic.umass.edu>
Source record: 176405

I know this is hard to believe, but I'm loking for an old SF354 singlle sided, single density drive for an Atari 520 ST. It is essentially the only computer in my parent's house, they don't want another one, and the two drives they have are so misaligned that they can no longer write to diskette. I would be interest in finding one or tow of these drives, even newer model if the price is right.

Thanks for your time, E-MAIL response preferred.

Dave T.

What do you consider "pathetic" disk performance? How many people need file server data transfer rates for the machine sitting on their desktop??? "Most PCs" (as you put it) do not have the transfer rates of a server, but what is the handicap in that there is no overkill? Anybody who wants to discuss this reasonably will concede to the fact that while most 16-bit IDE interfaces are not the fastest in the world, they are a far cry from "pathetic." I might consider an 8-bit MFM interface "pathetic", but I find it totally outside the bounds of reason to state that "MOST" PCs are. It is relevant to mention that almost ALL new PCs have a 32-bit disk interface.

> >4) Better keyboard (Which is quite important.)
>

> clicky keyboards that most cloners use. It's only slightly better than
> the IBM PS/1 keyboard, which is TERRIBLE.

Keyboard feel is an entirely subjective attribute. However, I wouldn't EVER go so far in my opinion to say that Atari made decent keyboards. I've seen to many of them go belly up - like the 130XE keyboards which appear to be made of the same quality (have the same look and feel) as the ST. Then again, I don't think that MOST PCs have pathetic disk access, so I could be wrong.

> >5) Cheaper hardware.
>
> Not if you want a decently put-together system. A '486 or Pentium
> system with good components and reasonable amounts of disk and RAM (like
> 16M of RAM and 500M disk) costs as much as a similarly equipped UNIX

486DX2/66Mhz, 8MB RAM, 256K cache, 420MB HD, VESA LB HD controller, VESA LB 1MB graphics card, 15" flat screen .28dp NI 1280x1024 monitor, HD floppy, DOS/WINDOWS/MOUSE. $1237 pg. 10 Computer Shopper11/94

This isn't 16MB of RAM or a 500MB hard drive (close) - but don't try and tell me that I can get a UNIX workstation for PC prices. Name your source - one that I can verify as easily as Computer Shopper. I've seen 545MB IDE drives going for $258, so upgrading the 420MB drive would be minimal additional cost. RAM is appx. $40/meg so we're looking at another $400 to take 'er to 16MB.

Anyone who fails to acknowledge the largest library of microcomputer software AVAILABLE ON THE EARTH must have their head somewhere where it shouldn't be. To fail to concede that ONE point about the PC.....just that ONE....makes a person so TOTALLY unreasonable that they should avoid discussion of computers altogether.

> These days, all
> you've got are PCs and Macs that aren't really that much different from
> the systems of 5-8 years ago. Sure they're faster, with better
> displays,

There's the contradiction of the week, folks. However, I'd like to add that besides being faster with better displays, they have enormous hard drives, and several times the RAM, full multimedia capabilities, local bus/VLB/PCI. No, I suppose I'm wrong. They had all that 8 years ago. My PC still has the same green-screen. We're just all been slipped hits of acid (unbeknownst to us, of course) and all the neat stuff you THINK you see is just an illusion. Right, Chris?
